

Micropower Voltage Reference with Comparator

ISL21440

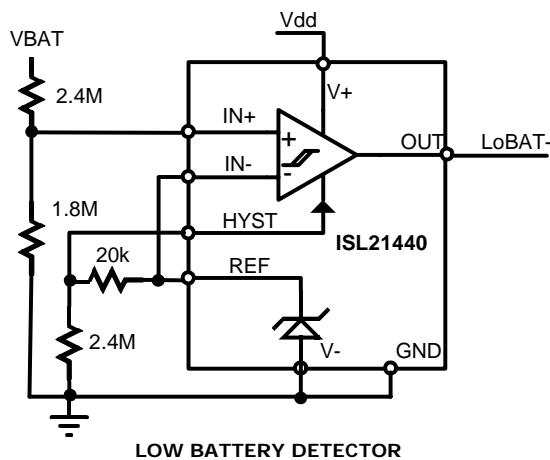

The ISL21440 is a micropower, FGA™ reference and comparator on a single chip. Drawing less than 1.8 μ A supply current over the full operating temperature range, the ISL21440 operates from a single 2V to 11V supply and can also be used with split bipolar supplies.

The ISL21440's on-board reference provides a 1.182V \pm 0.5% output. It features programmable hysteresis and TTL/CMOS compatible outputs that sink and source current. Low Bias currents permit high value divider resistors for typical circuit current drains of <2.5 μ A.

The low supply current makes the ISL21440 ideal for battery powered devices in battery level or low voltage monitors circuits.

The ISL21440 is a pin-compatible, performance upgrade of both the LTC1440, LTC1540, MAX921 and MAX931.

Typical Application

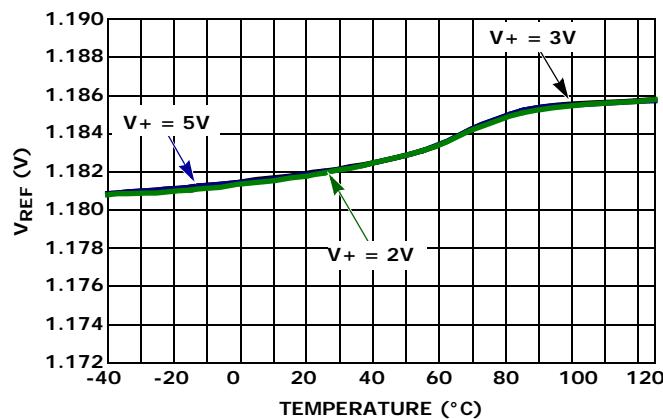

Features

- 1.8 μ A Supply Current Over Full Temperature Range
- Wide Supply Range 2V to 11V
- Precision 1.182V \pm 0.5% Voltage Reference
- Comparator with User Programmable Hysteresis
- Temperature Range -40°C to +125°C
- 8 Ld MSOP and 8 Ld TDFN Packages
- Pin Compatible Upgrade to MAX921 and LTC1440

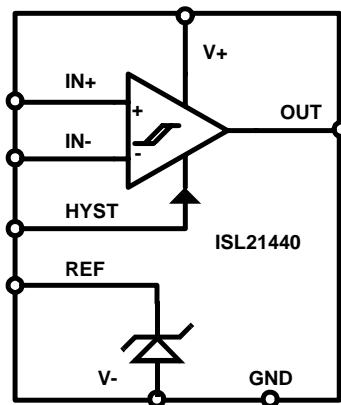

Applications* (see page 13)

- Low Battery Detector
- Low Voltage Reset
- Overvoltage Monitor
- Window Comparator

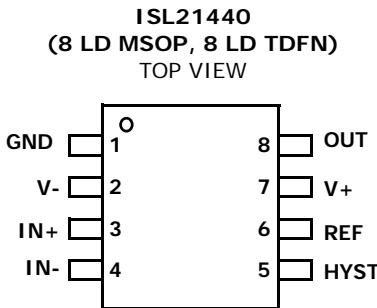

Reference Voltage vs Temperature

Pin Configuration

Pin Descriptions

PIN	SYMBOL	DESCRIPTION
1	GND	Ground pin. Sets the Comparator output low level.
2	V-	Negative Supply Input for Voltage Reference and Comparator.
3	IN+	Comparator non-inverting input pin. Range: V- to V+ -1.5V.
4	IN-	Comparator inverting input pin. Range: V- to V+ -1.5V
5	HYST	Comparator Hysteresis input. Accepts a voltage divided from the Reference output. Range is VREF - 50mV to VREF. Connect directly to VREF for zero hysteresis.
6	REF	Reference output. Source 2mA and Sink 10µA.
7	V+	Positive Supply Input for Comparator and Reference. Range is 2.0V to 11.0V
8	OUT	Comparator output, CMOS push-pull. Output swing referenced to V+ and GND.

NOTES:

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL21440](#). For more information on MSL please see techbrief [TB363](#).

Environmental Operating Conditions

X-Ray Exposure (Note 4) 10mRem

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

4. Measured with no filtering, distance of 10" from source, intensity set to 55kV and 70mA current, 30s duration. Other exposure levels should be analyzed for Output Voltage drift effects. See "Applications Information" on page 11.
5. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
6. For θ_{JC} , the "case temp" location is the center of the exposed metal pad on the package underside.
7. For θ_{JC} , the "case temp" location is taken at the package top center.
8. Post-reflow drift for the ISL21440 device voltage reference output will range from 100mV to 1.0mV based on experimental results with devices on FR4 double sided boards. The design engineer must take this into account when considering the reference voltage after assembly.

Functional Description

Device Power

The ISL21440 device has a single positive supply pin, V_+ , and two other supply pins, V_- and GND. Normally for single supply applications the V_- pin is tied to system ground as well as the GND pin. The separate ground pin allows the comparator to be powered by split supplies from $\pm 1.0V$ to $\pm 5.5V$. Note that the minimum supply voltage will be 0.8V above the comparator maximum input level for accurate operation.

Comparator Section

The comparator inputs can swing from the negative supply (GND pin) to within 0.8V of the positive supply (V_+). Alternatively, with the comparator input set at the 1.182V reference level, the minimum input voltage for accurate operation is 2.0V. If the inputs are expected to see voltage levels above V_+ or below ground, they should be clamped with low leakage Schottky diodes.

The CMOS output swings essentially from the GND potential to V_+ potential, depending on load current. If loads in excess of 1mA are expected, then a 0.1 μ F decoupling capacitor at the V_+ pin should be added.

Voltage Reference Section

The voltage reference is a micropower FGA reference and is set to $1.182V \pm 0.5\%$ at the factory. The reference output can source up to 2mA but the sink capability is very limited at only 10 μ A, maximum. Small value capacitors, up to 10nF, can be used on the reference output to lower noise if desired.

Applications Information

Handling and Board Mounting

FGA references provide excellent initial accuracy and low temperature drift at the expense of very little power drain. There are some precautions to take to insure this accuracy is not compromised. Excessive heat during solder reflow can cause excessive initial accuracy drift, so the recommended $+260^{\circ}C$ max

temperatura de 100°C no deve ser excedida. Expect up to 1mV drift from the solder reflow process.

FGA references are susceptible to excessive X-radiation like that used in PC board manufacturing. Initial accuracy can change 10mV or more under extreme radiation. If an assembled board needs to be X-rayed, care should be taken to shield the FGA reference device.

Hysteresis

The Hysteresis function allows for changing the value of the reference switch-over point depending on the previous state of the comparator. This works to remove the effects of noise or glitches in the voltage detection input and provide more reliable output transitions.

Hysteresis is added to the ISL21440 by connecting one resistor between the REF and HYST pins (R_{REF}), and another resistor (R_{HYST}) between the HYST pin and ground. The hysteresis voltage (V_H) is designed to be twice the voltage difference between the HYST pin and REF pin ($V_H = 2 * (V_{REF} - V_{HYST})$). Since the reference voltage is 1.182V (V_{REF}), Equations 1 and 2 for these two resistors are shown as follows:

$$R_{REF} = V_H / (2 * I_{REF}) = (V_{REF} - V_{HYST}) / I_{REF} \quad (\text{EQ. 1})$$

$$R_{HYST} = (1.182 - V_H / 2) / I_{REF} = V_{HYST} / I_{REF} \quad (\text{EQ. 2})$$

I_{REF} is chosen to be less than the maximum output of the reference, usually 5 μ A is a safe value but for lowest power, 0.1 μ A can be used.

If the hysteresis is not used, the HYST pin should be tied to the REF pin.

Board Assembly Considerations

FGA references provide high accuracy and low temperature drift but some PC board assembly precautions are necessary. Normal Output voltage shifts of 100 μ V to 1mV can be expected with Pb-free reflow profiles or wave solder on multi-layer FR4 PC boards. Precautions should be taken to avoid excessive heat or extended exposure to high reflow or wave solder temperatures, this may reduce device initial accuracy.

Post-assembly X-ray inspection may also lead to permanent changes in device output voltage and should be minimized or avoided. If X-ray inspection is required, it is advisable to monitor the reference output voltage to verify excessive shift has not occurred. If large amounts of shift are observed, it is best to add an X-ray shield consisting of thin zinc (300 μ m) sheeting to allow clear imaging, yet block x-ray energy that affects the FGA reference.

Special Applications Considerations

In addition to post-assembly examination, there are also other X-ray sources that may affect the FGA reference long term accuracy. Airport screening machines contain X-rays and will have a cumulative effect on the voltage reference output accuracy. Carry-on luggage screening uses low level X-rays and is not a major source of output voltage shift, although if a product is expected to pass through that type of screening over 100x it may need to consider shielding with copper or aluminum. Checked luggage X-rays are higher intensity and can cause output voltage shift in much fewer passes, so devices expected to go through those machines should definitely consider shielding. Note that just two layers of 1/2 ounce copper planes will reduce the received dose by over 90%. The lead frame for the device which is on the bottom also provides similar shielding.

If a device is expected to pass through luggage X-ray machines numerous times, it is advised to mount a 2-layer (minimum) PC board over the top of the package, which along with a ground plane underneath will effectively shield it from 50 to 100 passes through the machine. Since these machines vary in X-ray dose delivered, it is difficult to produce an accurate maximum pass recommendation.

Typical Applications

Low Battery Detector

Figure 24 shows a typical implementation for the ISL21440, a low battery detector. The values for R_{REF} and R_{HYST} provide 20mV of hysteresis and 0.5 μ A I_{REF} . The input trip point for V_{detect} is the same as the reference voltage, 1.182V, and a resistor divider at the input sets the $LoBAT$ trip point at 2.7V. The total current draw for the circuit is going to be 1.1 μ A for V_{DD} and 0.6 μ A for V_{BAT} .

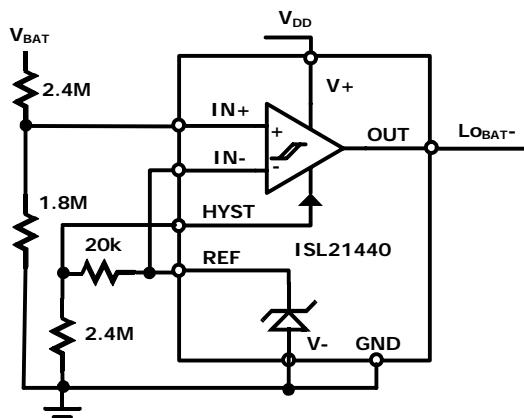

FIGURE 24. LOW BATTERY DETECTOR WITH HYSTERESIS

Window Comparator

The ISL21440 can be combined with a micropower to produce a window comparator circuit. The circuit in Figure 25 uses a 3 resistor divider to produce high and low trip points, and the ISL28197 (800nA supply current) comparator is added to give the second output. The two outputs can be used separately for over or undervoltage indication, or a gate can be added as shown to report either in-window or out-of window condition.

The resistors are shown as Equations 3, 4 and 5 as follows.

Set:

$$R_2 = 1M(1\%) \quad (EQ. 3)$$

$$R_2 = R_3 [V_H/V_L - 1] \quad (EQ. 4)$$

$$R_1 = R_2([V_H/V_{REF} - 1] - R_2) \quad (EQ. 5)$$

Example: For $V_H = 3.8V$, $V_L = 2.7V$ ($3.3V \pm 0.5V$)

$R_2 = 402k$ $R_1 = 1.82M$ (can be 1%)

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL21440](#)

To report errors or suggestions for this datasheet, please go to www.intersil.com/askourstaff

FITs are available from our website at <http://rel.intersil.com/reports/search.php>

The resulting circuit draws about $3\mu\text{A}$ and works down to $V_{DD} = 2.2\text{V}$.
