8 bit 30/50 MSPS Flash A/D Converter

Evaluation Board Available — CXA1016PPCB/CXA1016KPCB
CXA1056PPCB/CXA1056KPCB

Description

CXA1016P/CXA1016K/CXA1056P/CXA1056K are 8 bit high-speed A/D converter ICs for various applications. They can be used widely for various purposes which require high-speed A/D conversions.

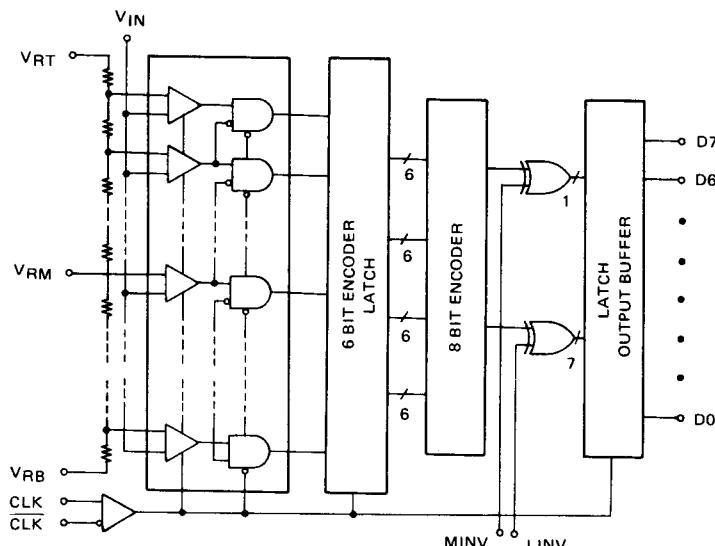

CXA1016P/CXA1056P are assembled in the plastic DIP packages and CXA1016K/CXA1056K are in the ceramic lead-less chip carriers.

**Features (CXA1016P/CXA1016K)**

- Resolution 8 bits \pm 1/2 LSB
- High-speed operation Maximum conversion Rate 30 MSPS
- Wide analog input bandwidth 30MHz (-3dB)
- Low input capacitance 35 pF (typ)
- Low power consumption 420 mW (typ)

Features (CXA1056P/CXA1056K)

- Resolution 8 bits \pm 1/2 LSB
- High-speed operation Maximum conversion Rate 50 MSPS
- Wide analog input bandwidth 50MHz (-3dB)
- Low input capacitance 35 pF (typ)
- Low power consumption 550 mW (typ)

Pin Description

Symbol	Function
AVEE	Analog VEE, -5.2V (typ). Coupled with $\sim 6\Omega$ between DVEE.
LINV	Input pin for output polarity inversion of D0 (LSB)~D6. (See the code table)
DVEE	Digital VEE, -5.2V (typ).
DGND	Digital GND, which is separated from the Analog GND.
D0~D7	Digital data output pin, ECL level. D0: LSB~D7: MSB. Pull-down resistors are necessary externally.
MINV	Input pin for output polarity inversion of D7 (MSB) (See the code table). ECL level. "0" level is held when it is released.
CLK	Inverse clock input pin, ECL level.
CLK	Clock input pin, ECL level.
V _{RB}	Reference voltage (bottom), -2V (typ).
AGND	Analog GND
V _{IN}	Analog input, input range is V _{RT} ~V _{RB}
V _{RM}	Middle point of the reference voltage, it can be used as a linearity correction pin.
V _{RT}	Reference voltage (top), OV (typ).
	Empty pins (not connected), 2 and 19 are used to be grounded to DGND, the others are used to be grounded to AGND.

Description of Function (See the block diagram and timing chart.)

1. The reference voltage, which is obtained by dividing equally the voltage across V_{RT} to V_{RB} into 256 by the reference resistor ladder, is applied to the respective \oplus (positive) input sides of 256 clocked comparators. An analog input is applied to the \ominus (negative) input sides of all the 256 clocked comparators from the V_{IN} pin.
2. When the state of CLK is in Low, the master (front stage) of the comparator compares the respective reference voltage and the analog input voltage which is ever-changing.
3. When the CLK moves from Low into Hi, each master latches the state immediately prior to the above simultaneously, and as a result, it provides conditions of "11 . . . 1100 . . 0" in sequence from the V_{RT} side to the V_{RB} side.
4. The output of the master is ANDed between the respective adjacent outputs, and "1" stands only when neighboring 2 outputs become "10", and the all other outputs become "0".
5. The result of the AND is latched when CLK moves from Hi into Low. Output of the slave is divided into 4 blocks and each block has 32 clocked comparators, and they are coded into binary codes of 6 bits respectively by the transistor matrix circuit.
6. The 6 bit codes are further coded into 8 bit codes by the transistor matrix circuit after they are respectively latched, and they are then output into the ECL level by the output buffer after being 8 bit latched. The output data is delayed 1 clock from the data sampling point and appears at the output pin.
7. Two polarity inversion inputs such as MINV and LINV are fed externally to the output buffer, and each of them selects output polarity of MSB and other polarity than MSB respectively.
