

RAD-TOLERANT CLASS V, WIDEBAND OPERATIONAL AMPLIFIER

FEATURES

- **Wide Bandwidth: 1 GHz**
- **Minimum Gain of 2 V/V (6 dB)**
- **High Slew Rate: 800 V/ μ s**
- **Low Voltage Noise: 2.4 nV/ $\sqrt{\text{Hz}}$**
- **Single Supply: 5 V, 3 V**
- **Quiescent Current: 18 mA**
- **Rad-Tolerant: 150 kRad (Si) TID**
- **QML-V Qualified, SMD 5962-07219**

APPLICATIONS

- **Active Filter**
- **ADC Driver**
- **Ultrasound**
- **Gamma Camera**
- **RF/Telecom**

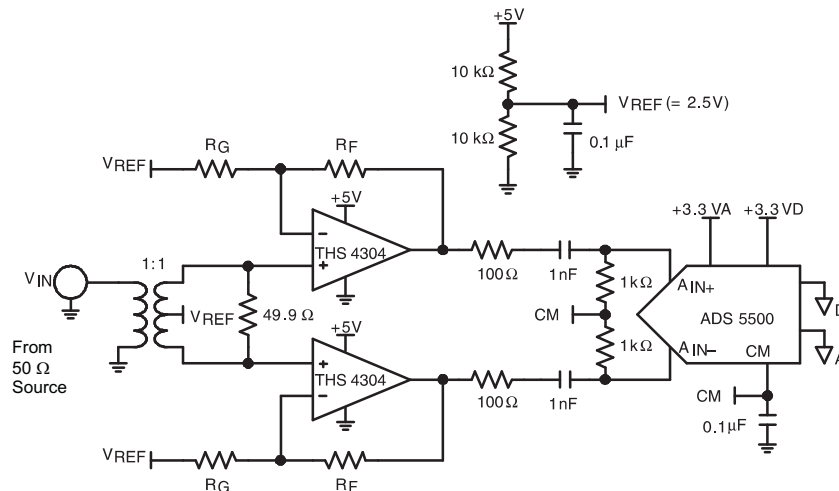

DESCRIPTION/ORDERING INFORMATION

The THS4304 is a wideband, voltage-feedback operational amplifier designed for use in high-speed analog signal processing chains operating with a single 5 V power supply. Developed in the BiCom3 silicon germanium process technology, the THS4304 offers best-in-class performance using a single 5 V supply as opposed to previous generations of operational amplifiers requiring ± 5 V supplies.

The THS4304 is a traditional voltage-feedback topology that provides the following benefits: balanced inputs, low offset voltage and offset current, low offset drift, high common mode and power supply rejection ratio.

The THS4304 is offered in 10-pin ceramic flatpack (U) and is specified over the full military temperature range, -55°C to 125°C .

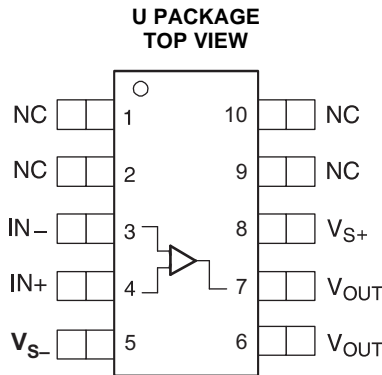

DIFFERENTIAL ADC DRIVE

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

NC – No internal connection

ORDERING INFORMATION⁽¹⁾

PACKAGED DEVICES	PACKAGE TYPE ⁽²⁾	PACKAGE MARKINGS	TRANSPORT MEDIA, QUANTITY
5962-0721901VHA	Ceramic Flatpack	0721901VHA	Tubes, 25

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.
- (2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

DISSIPATION RATINGS

PACKAGE	θ_{JC} (°C/W)	θ_{JA} (°C/W)	POWER RATING ⁽¹⁾		
			$T_A \leq 25^\circ\text{C}$	$T_A = 85^\circ\text{C}$	$T_A = 125^\circ\text{C}$
U (10)	14.7	189	661 mW	344 mW	132 mW

- (1) Power rating determined for a maximum junction temperature of 150°C. However, distortion starts to substantially increase above 125°C. Thermal management of the final PCB should strive to keep the junction temperature at or below 125°C for best performance and long-term reliability.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		UNIT
V_S	Supply voltage	+6.0 V
V_I	Input voltage	$\pm V_S$
I_O	Output current	150 mA
V_{ID}	Differential input voltage	± 2 V
Continuous power dissipation		See Dissipation Rating Table
T_J	Maximum junction temperature, any condition ⁽²⁾	150°C
T_{stg}	Storage temperature range	-65°C to 150°C
ESD Ratings	HBM	1600 V
	CDM	1000 V
	MM	100 V

- (1) The absolute maximum ratings under any condition is limited by the constraints of the silicon process. Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) The maximum junction temperature for continuous operation is limited by package constraints. Operation above this temperature may result in reduced reliability and/or lifetime of the device.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT

APPLICATION INFORMATION

For many years, high-performance analog design has required the generation of split power supply voltages, like ± 15 V, ± 8 V, and more recently ± 5 V, to realize the full performance of the amplifiers available. Modern trends in high-performance analog are moving toward single-supply operation at 5 V, 3 V, and lower. This reduces power-supply cost due to less voltage being generated and conserves energy in low-power applications. It also can take a toll on available dynamic range, a valuable commodity in analog design, if the available voltage swing of the signal also must be reduced.

Two key figures of merit for dynamic range are signal-to-noise ratio (SNR) and spurious free dynamic range (SFDR).

SNR is simply the signal level divided by the noise:

$$\text{SNR} = \frac{\text{Signal}}{\text{Noise}}$$

and SFDR is the signal level divided by the highest spur:

$$\text{SFDR} = \frac{\text{Signal}}{\text{Spur}}$$

In an operational amplifier, reduced supply voltage typically results in reduced signal levels due to lower voltage available to operate the transistors within the amplifier. When noise and distortion remain constant, the result is a commensurate reduction in SNR and SFDR. To regain dynamic range, the process and the architecture used to make the operational amplifier must have superior noise and distortion performance with lower power supply overhead required for proper transistor operation.

The THS4304 BiCom3 operational amplifier is just such a device. It is able to provide 2 V_{pp} signal swing at its output on a single 5 V supply with noise and distortion performance similar to the best 10 V operational amplifiers on the market today

GENERAL APPLICATION

The THS4304 is a traditional voltage-feedback topology with wideband performance up to 1 GHz at a gain of 2 V/V. Care must be taken to ensure that parasitic elements do not erode the phase margin.

Capacitance at the output and inverting input, and resistance and inductance in the feedback path, can cause problems.

To reduce parasitic capacitance, the ground plane should be removed from under the part. To reduce inductance in the feedback, the circuit traces should be kept as short and direct as possible.

For a gain of +2V/V, it is recommended to use a 249 Ω feedback resistor. With good layout, this should keep the frequency response peaking to around 6 dB. This resistance is high enough to not load the output excessively, and the part is capable of driving 100 Ω load with good performance. Higher-value resistors can be used, with more peaking. Lower-value feedback resistors also can be used to reduce peaking, but degrade the distortion performance with heavy loads.

Power supply bypass capacitors are required for proper operation. The most critical are 0.1 μ F ceramic capacitors; these should be placed as close to the part as possible. Larger bulk capacitors can be shared with other components in the same area as the operational amplifier.

HARMONIC DISTORTION

For best second harmonic (HD₂), it is important to use a single-point ground between the power supply bypass capacitors when using a split supply. It also is recommended to use a single ground or reference point for input termination and gain-setting resistors (R₈ and R₁₁ in the non-inverting circuit). It is recommended to follow the EVM layout closely in your application.

EVALUATION MODULES

The THS4304 has two evaluation modules (EVMs) available. One is for the MSOP (DGK) package and the other for the SOT-23 (DBV) package. These provide a convenient platform for evaluating the performance of the part and building various different circuits. The full schematics, board layout, and bill of materials (as supplied) for the boards are shown in the following illustrations.

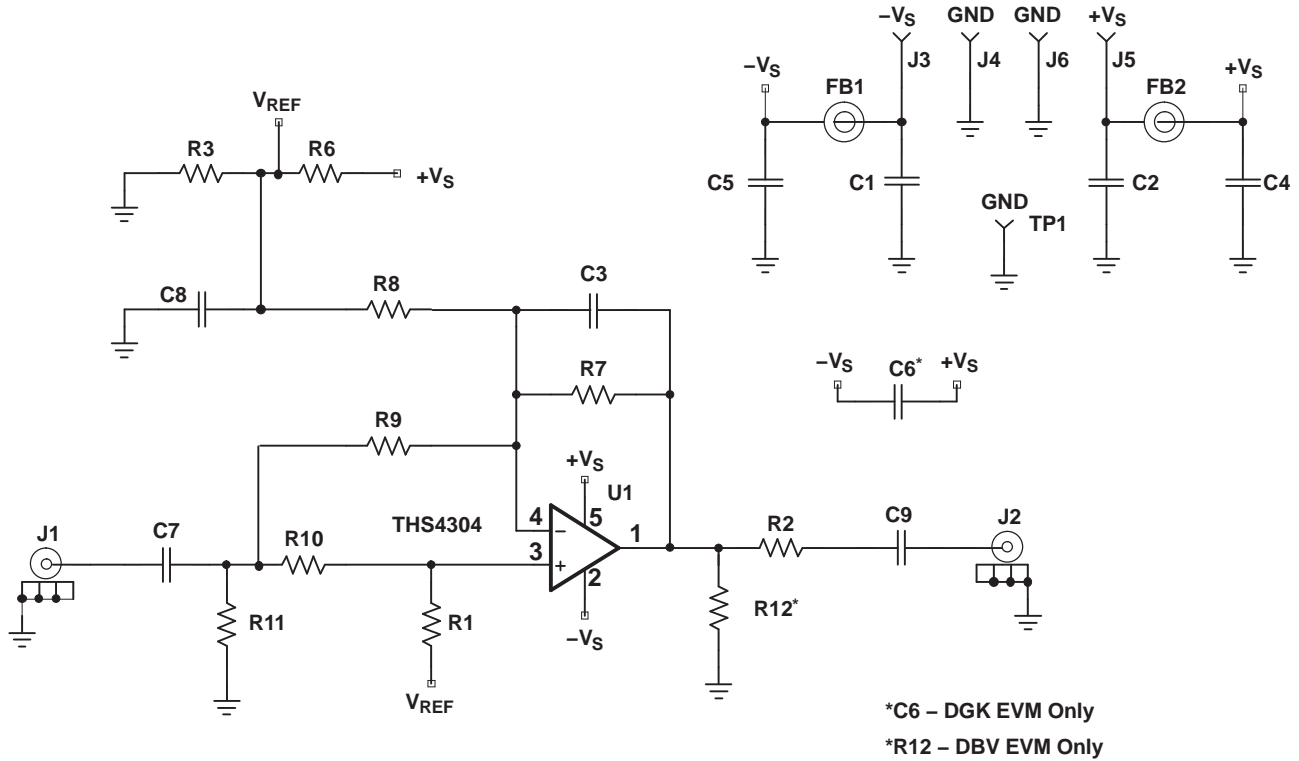

Figure 37. EVM Full Schematic

NON-INVERTING GAIN WITH SPLIT SUPPLY

The following schematic shows how to configure the operational amplifier for non-inverting gain with split power supply ($\pm 2.5V$). This is how the EVM is supplied from TI. This configuration is convenient for test purposes because most signal generators and analyzer are designed to use ground-referenced signals by default. Note the input and output provides 50 Ω termination.

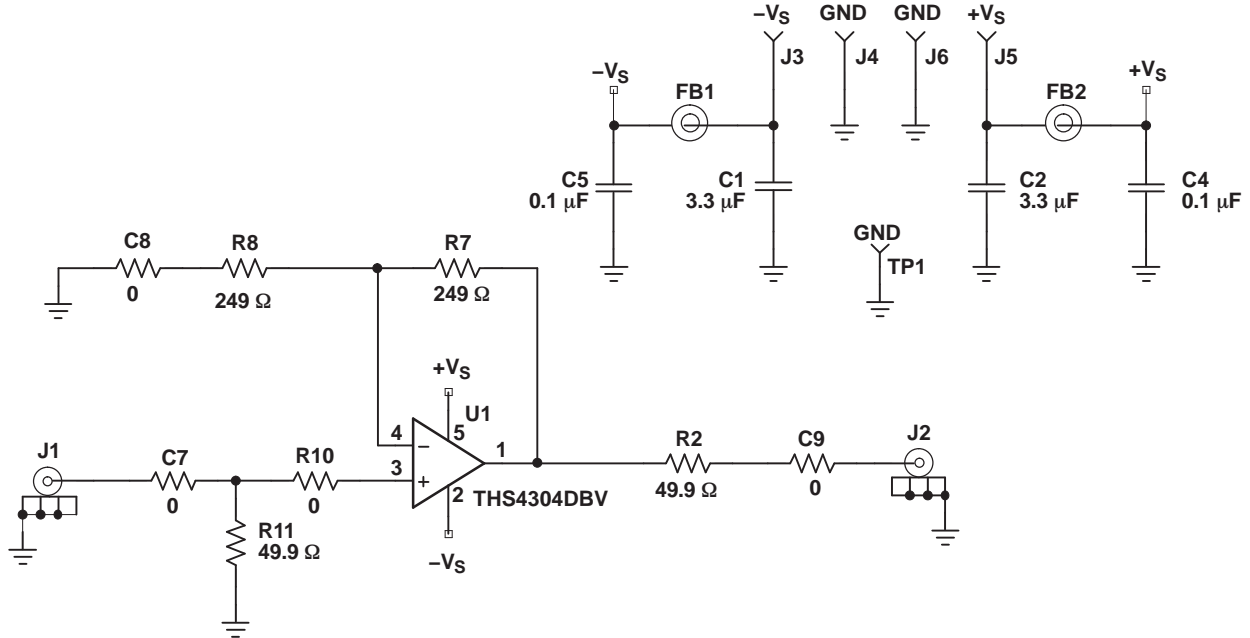

Figure 42. Non-Inverting Gain With Split Power Supply

INVERTING GAIN WITH SPLIT POWER SUPPLY

The following schematic shows how to configure the operational amplifier for inverting gain of 1 (-1 V/V) with split power supply (± 2.5 V). Note the input and output provides $50\ \Omega$ termination for convenient interface to common test equipment.

Figure 43. Inverting Gain With Split Power Supply

NON-INVERTING SINGLE-SUPPLY OPERATION

The THS4304 EVM can easily be configured for single 5 V supply operation, as shown in the following schematic, with no change in performance. This circuit passes dc signals at the input, so care must be taken to reference (or bias) the input signal to mid-supply.

If dc operation is not required, the amplifier can be ac coupled by inserting a capacitor in series with the input (C7) and output (C9).

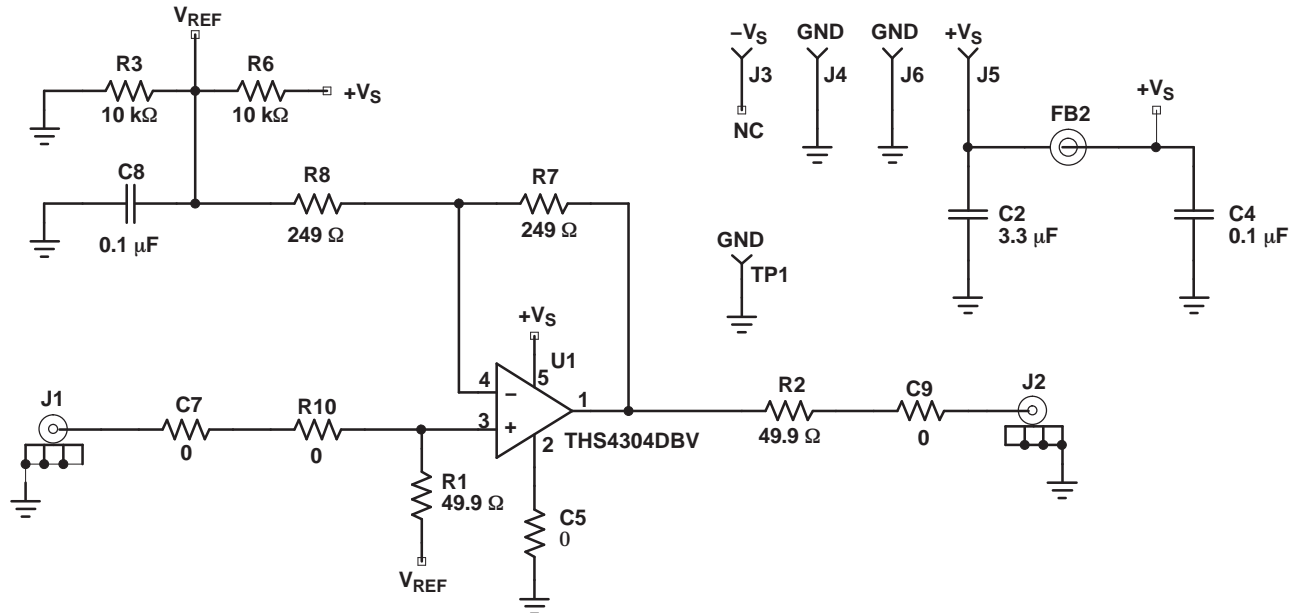

Figure 44. Non-Inverting 5-V Single-Supply Amplifier

DIFFERENTIAL ADC DRIVE AMPLIFIER

The circuit shown in [Figure 44](#) is adapted as shown in [Figure 45](#) to provide a high-performance differential amplifier drive circuit for use with high-performance ADCs, like the ADS5500 (14 bit 125 MSP ADC). For testing purposes, the circuit uses a transformer to convert the signal from a single-ended source to differential. If the input signal source in your application is differential and biased to mid-rail, no transformer is required.

The circuit employs two amplifiers to provide a differential signal path to the ADS5500. A resistor divider (two 10 kΩ resistors) is used to obtain a mid-supply reference voltage of 2.5 V (VREF) (the same as shown in the single-supply circuit of [Figure 44](#)). Applying this voltage to the one side of RG and to the positive input of the operational amplifier (via the center-tap of the transformer) sets the input and output common-mode voltage of the operational amplifiers to mid-rail to optimize their performance. The ADS5500 requires an input common-mode voltage of 1.5 V. Due to the mismatch in required common-mode voltage, the signal is ac coupled from the amplifier output, via the two 1 nF capacitors, to the input of the ADC. The CM voltage of the ADS5500 is used to bias the ADC input to the required voltage, via the 1 kΩ resistors. Note: 100 μA common-mode current is drawn by the ADS5500 input stage (at 125 MSPS). This causes a 100 mV shift in the input common-mode voltage, which does not impact the performance when driving the input to -1 dB of full scale. To offset this effect, a voltage divider from the power supply can be used to derive the input common-mode voltage reference.

Because the operational amplifiers are configured as non-inverting, the inputs are high impedance. This is particularly useful when interfacing to a high-impedance source. In this situation, the amplifiers provide impedance matching and amplification of the signal.

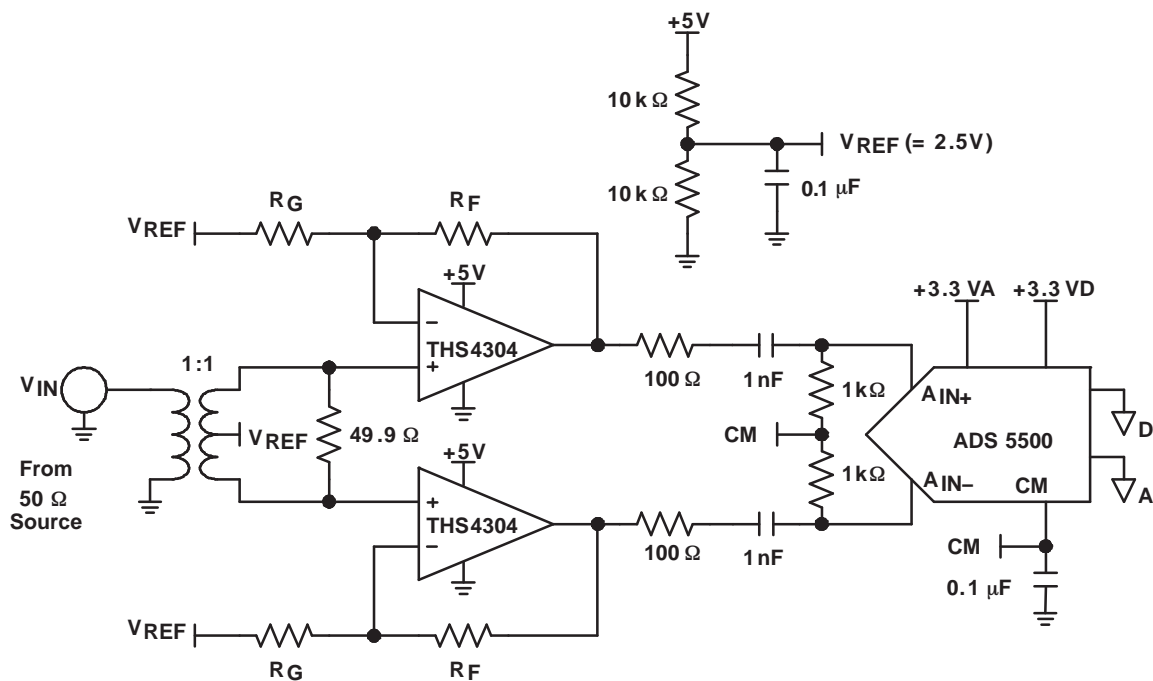

Figure 45. Differential ADC Drive Amplifier Circuit

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
5962-0721901VHA	ACTIVE	CFP	U	10	1	TBD	A42	N / A for Pkg Type

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

U (S-GDFP-F10)

CERAMIC DUAL FLATPACK

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. This package can be hermetically sealed with a ceramic lid using glass frit.
 - D. Index point is provided on cap for terminal identification only.
 - E. Falls within MIL STD 1835 GDFP1-F10 and JEDEC MO-092AA

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
