ACPM-7821
4 x 4 Power Amplifier Module for J-CDMA (898 – 925 MHz)

Data Sheet

Description

The ACPM-7821 is a CDMA (Code Division Multiple Access) power amplifier module designed for handsets operating in the 898–925MHz bandwidth. The ACPM-7821 meets stringent CDMA linearity requirements up to 28 dBm output power.

A low current (Vcont) pin is provided for high efficiency improvement of the low output power range. The ACPM-7821 features CoolPAM circuit technology offering state-of-the-art reliability, temperature stability and ruggedness.

ACPM-7821 is self contained, incorporating 50 ohm input and output matching networks.

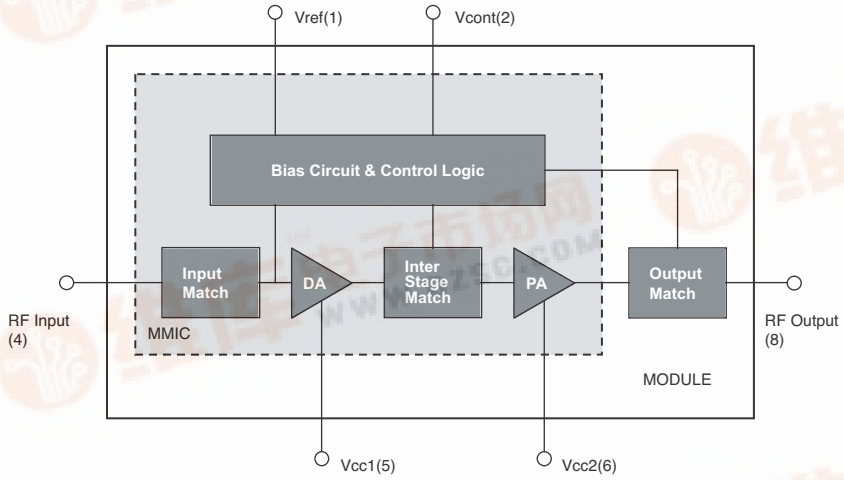
Features

- Excellent linearity
- High efficiency
- 10-pin surface mounting package (4 mm x 4 mm x 1.1 mm)
- Low quiescent current
- Internal 50Ω matching networks for both RF input and output
- CDMA 95A/B, CDMA2000-1X/EVDO

Applications

- Digital Cellular (J-CDMA)

Functional Block Diagram



Ordering Information

Part Number	No. of Devices	Container
ACPM-7821-TR1	1000	7" Tape and Reel
ACPM-7821-BLK	100	Bulk

Table 1. Absolute Maximum Ratings[1]

Parameter	Symbol	Min.	Nominal	Max.	Unit
RF Input Power	P_{in}	–	–	10.0	dBm
DC Supply Voltage	V_{cc}	0	3.4	5.0	V
DC Reference Voltage	V_{ref}	0	2.85	3.3	V
Control Voltage	V_{cont}	0	2.85	3.3	V
Storage Temperature	T_{stg}	-55	–	+125	°C

Table 2. Recommended Operating Conditions

Parameter	Symbol	Min.	Nominal	Max.	Unit
DC Supply Voltage	V_{cc}	3.2	3.4	4.2	V
DC Reference Voltage	V_{ref}	2.75	2.85	2.95	V
Mode Control Voltage					
– High Power Mode	V_{cont}	–	0	–	V
– Low Power Mode	V_{cont}	–	2.85	–	V
Operating Frequency	Fo	898	–	925	MHz
Case Operating Temperature	To	-30	25	85	°C

Table 3. Power Range Truth Table

Power Mode	Symbol	Vref	Vcont[2]	Range
High Power Mode	PR2	2.85	Low	~28 dBm
Low Power Mode	PR1	2.85	High	~17 dBm
Shut Down Mode	–	0	–	–

Notes:

1. No damage assuming only one parameter is set at limit at a time with all other parameters set at or below nominal value.
2. High (2.0V – 3.0V), Low (0.0V – 0.5V).

Table 4. Electrical Characteristics for CDMA Mode (Vcc = 3.4V, Vref = 2.85V, T=25°C)

Characteristics		Symbol	Condition	Min.	Typ.	Max.	Unit

Package Dimensions and Pin Descriptions, continued

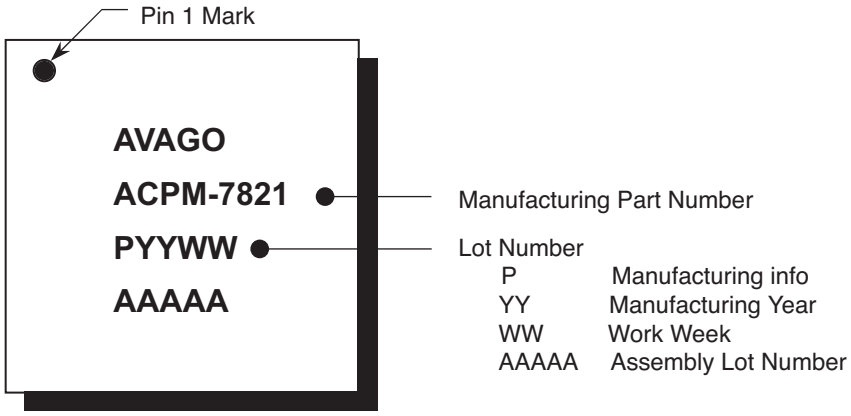

Figure 9. Marking Specifications.

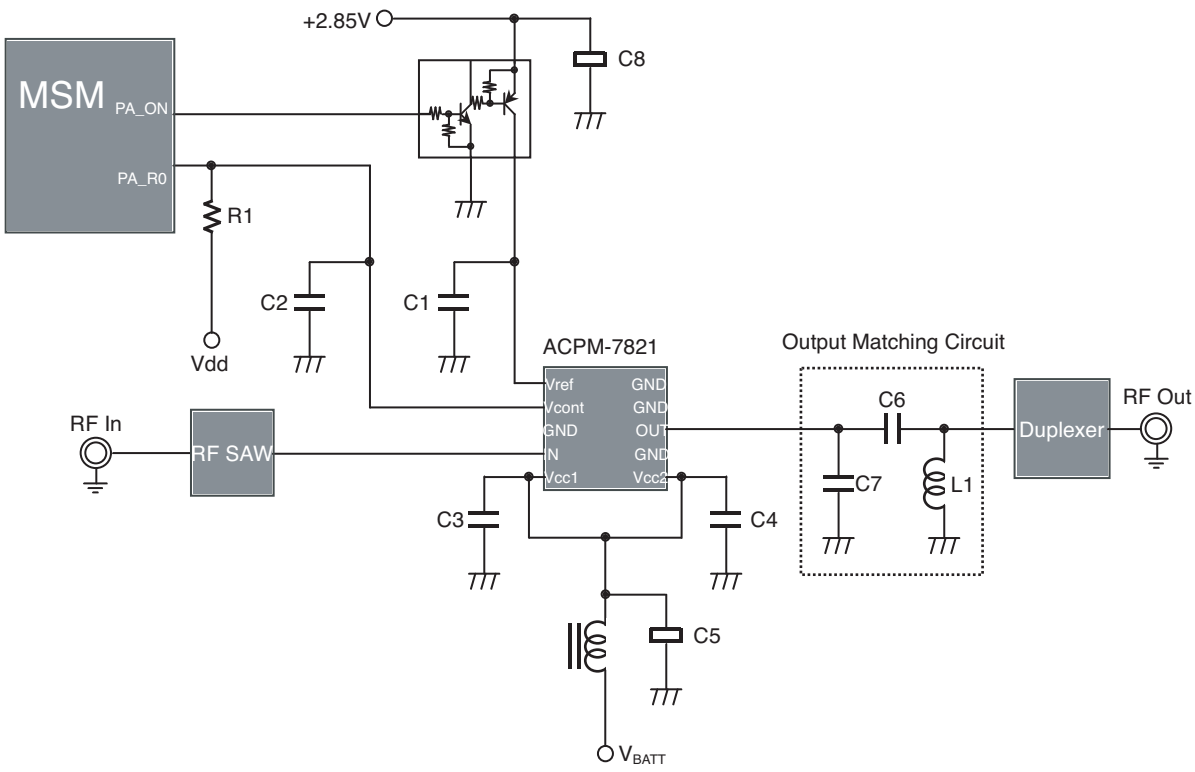
Peripheral Circuit in Handset



Notes:

- Recommended voltage for Vref is 2.85V
- Place C1 near to Vref pin.
- Place C3 and C4 close to pin 5 (Vcc1) and pin 6 (Vcc2). These capacitors can affect the RF performance
- Use 50Ω transmission line between PAM and Duplexer and make it as short as possible to reduce conduction loss
- π-type circuit topology is good to use for matching circuit between PA and Duplexer.
- Pull-up resistor(R1) should be used to limit current drain. 6.2kΩ is recommended for ACPM-7821

Figure 10. Peripheral Circuit.

Calibration

Calibration procedure is shown in Figure 11. Two calibration tables, high mode and low mode respectively, are required for CoolPAM, which is due to gain difference in each mode.

For continuous output power at the mode change points, the input power should be adjusted according to gain step during the mode change.

Offset Value
(difference between rising point and falling point)

Offset value, which is the difference between the rising point (output power where PA mode changes from low mode to high mode) and falling point (output power where PA mode changes from high mode to low mode), should be adopted to prevent system oscillation. 3 to 5 dB is recommended for Hysteresis.

Average Current and Talk Time

Probability Distribution Function implies that what is important for longer talk time is the efficiency of low or medium power range rather than the efficiency at full power. ACPM-7821 idle current is 14 mA and operating current at 17 dBm is 68 mA at nominal condition. This PA with low current consumption prolongs talk time by no less than 30 minutes compared to other PAs.

$$Average\ current = \int (PDF \times Current)\,dp$$

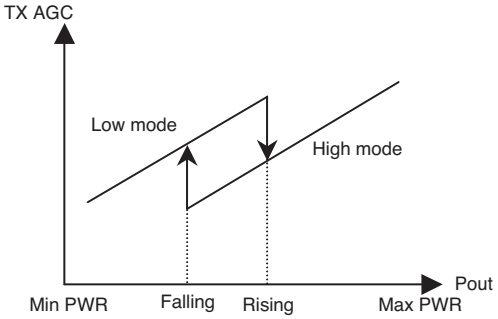


Figure 11. Calibration procedure.

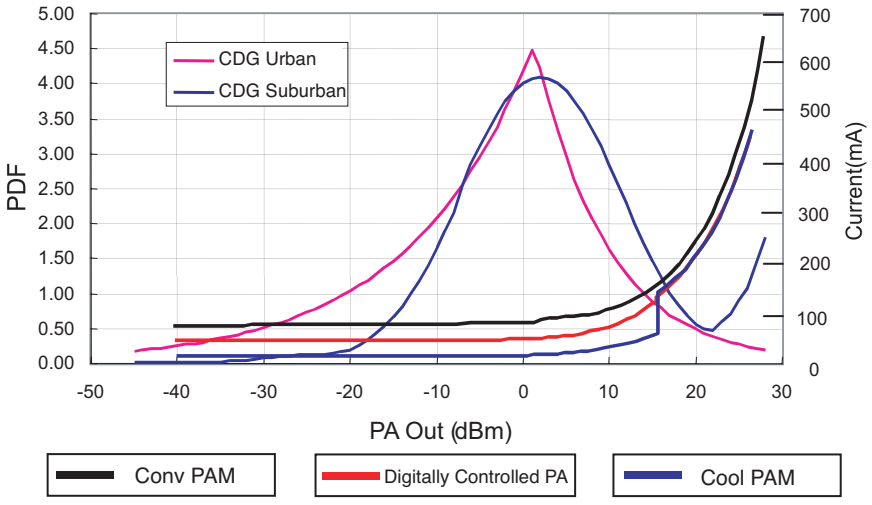

Figure 13. CDMA Power Distribution Function.

PCB Design Guidelines

The recommended ACPM-7821 PCB Land pattern is shown in Figure 14 and Figure 15. The substrate is coated with solder mask between the I/O and conductive paddle to protect the gold pads from short circuit that is caused by solder bleeding/bridging.

Stencil Design Guidelines

A properly designed solder screen or stencil is required to ensure optimum amount of solder paste is deposited onto the PCB pads.

The recommended stencil layout is shown in Figure 16. Reducing the stencil opening can potentially generate more voids. On the other hand, stencil openings larger than 100% will lead to excessive solder paste smear or bridging across the I/O pads or conductive paddle to adjacent I/O pads. Considering the fact that solder paste thickness will directly affect the quality of the solder joint, a good choice is to use laser cut stencil composed of 0.100 mm (4 mils) or 0.127 mm (5 mils) thick stainless steel which is capable of producing the required fine stencil outline.

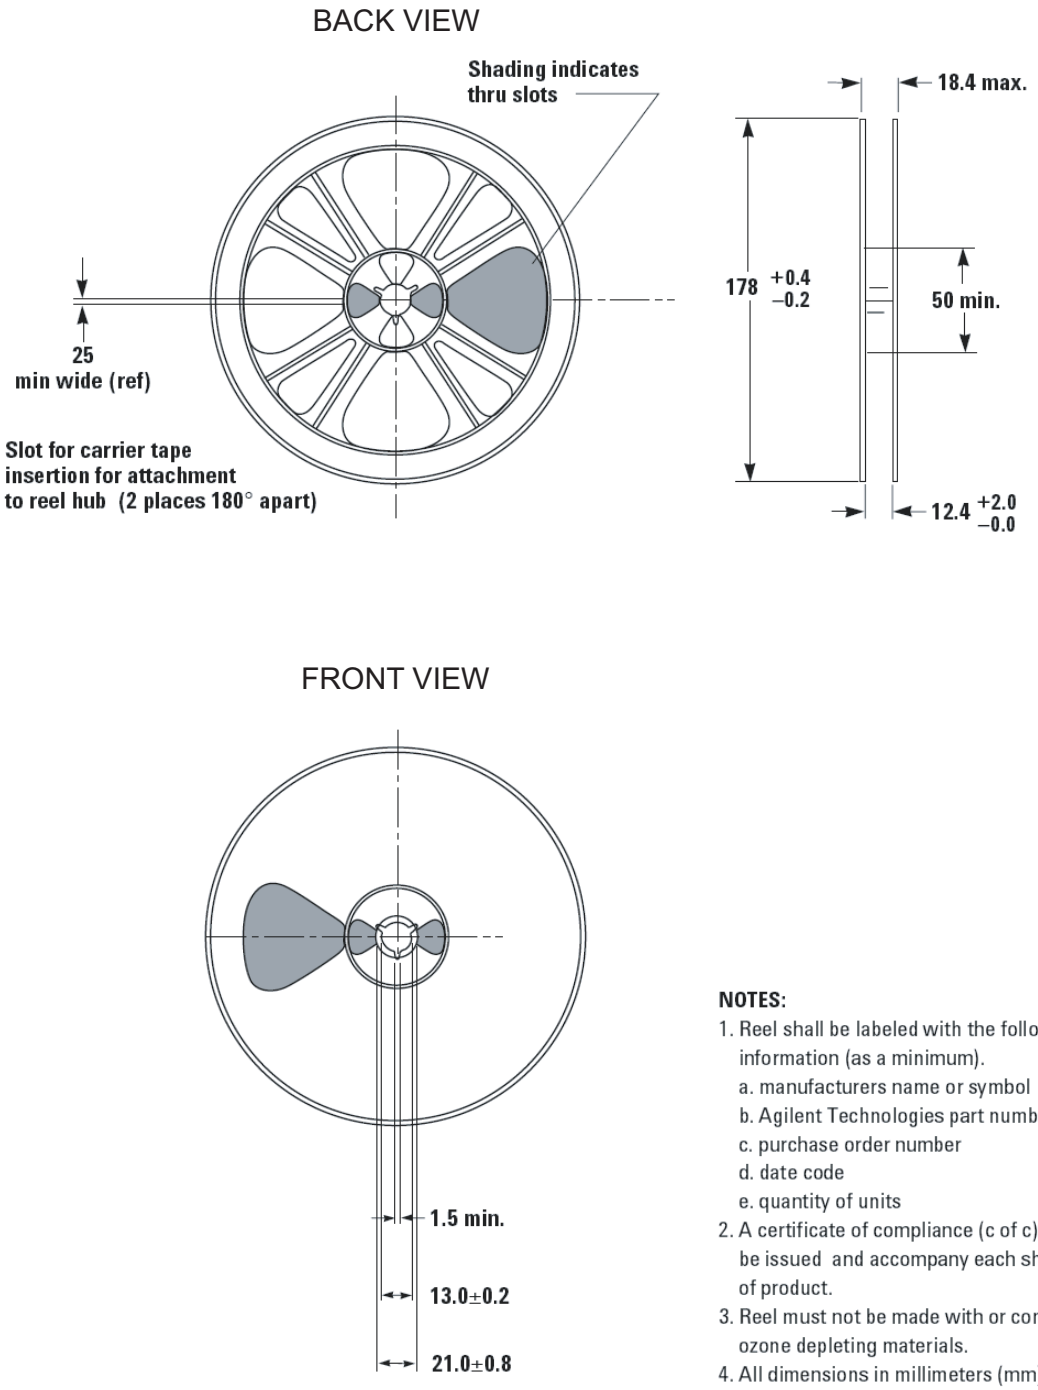
Figure 17. Tape and Reel Format – 4 mm x 4 mm.

Reel Drawing



NOTES:

1. Reel shall be labeled with the following information (as a minimum).
   a. manufacturers name or symbol
   b. Agilent Technologies part number
   c. purchase order number
   d. date code
   e. quantity of units
2. A certificate of compliance (c of c) shall be issued and accompany each shipment of product.
3. Reel must not be made with or contain ozone depleting materials.
4. All dimensions in millimeters (mm)

Figure 18. Plastic Reel Format–13"/4".

Handling and Storage

ESD (Electrostatic Discharge)

Electrostatic discharge occurs naturally in the environment. With the increase in voltage potential, the outlet of neutralization or discharge will be sought. If the acquired discharge route is through a semiconductor device, destructive damage will result. ESD countermeasure methods should be developed and used to control potential ESD damage during handling in a factory environment at each manufacturing site.

MSL (Moisture Sensitivity Level)

Plastic encapsulated surface mount package is sensitive to damage induced by absorbed moisture and temperature. Avago follows JEDEC Standard J-STD 020A. Each component and package type is classified for moisture sensitivity by soaking a known dry package at various temperatures and relative humidity, and times. After soak, the components are subjected to three consecutive simulated reflows.

The out of bag exposure time maximum limits are determined by the classification test describe above which corresponds to an MSL classification level 6 to 1 according to the JEDEC standard IPC/JEDEC J-STD-020A and J-STD-033.

ACPM-7821 is MSL3. Thus, according to the J-STD-033 p.11 the maximum Manufacturers Exposure Time (MET) for this part is 168 hours. After this time period, the part would need to be removed from the reel, de-taped and then re-bake.

MSL classification reflow temperature for the ACPM-7821 is targeted at 250°C +0/-5°C. Figure 19 and Table 7 show typical SMT profile for maximum temperature of 250°C +0/-5°C.

Table 5. ESD Classification

Pin#	HBM		MM		CDM	
	Rating	Class	Rating	Class	Rating	Class
All Pins	±1000V	Class 1C (JESD22-A115-A)	± 200V	Class B	± 200V	Class II (JESD22-C101C)

Note:
1. PA module products should be considered extremely ESD sensitive.

Table 6. Moisture Classification Level and Floor Life

MSL Level	Floor Life (out of bag) at factory ambient ≤30°C/60% RH or as stated
1	Unlimited at ≤30°C/85% RH
2	1 year
2a	4 weeks
3	**168 hours**
4	72 hours
5	48 hours
5a	24 hours
6	Mandatory bake before use. After bake, must be reflowed within the time limit specified on the label

Note:
1. The MSL Level is marked on the MSL Label on each shipping bag.

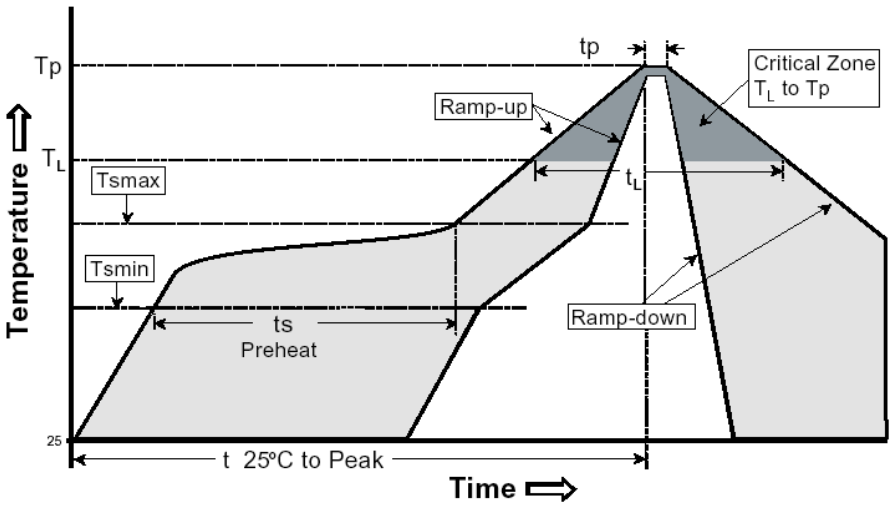


Figure 19. Typical SMT Reflow Profile for Maximum Temperature = 250 +0/-5°C.

Table 7. Typical SMT Reflow Profile for Maximum Temperature = 250+0/-5°C

Profile Feature	Sn-Pb Solder	Pb-Free Solder
Average ramp-up rate (T_L to T_P)	3°C/sec max	3°C/sec max
Preheat		
- Temperature Min (Tsmin)	100°C	100°C
- Temperature Max (Tsmax)	150°C	150°C
- Time (min to max) (ts)	60–120 sec	60–180 sec
Tsmax to T_L		
- Ramp-up Rate		3°C/sec max
Time maintained above:		
- Temperature (T_L)	183°C	217°C
- Time (T_L)	60–150 sec	60–150 sec
Peak Temperature (T_p)	225 +0/-5°C	250 +0/-5°C
Time within 5°C of actual Peak Temperature (tp)	10–30 sec	10–30 sec
Ramp-down Rate	6°C/sec max	6°C/sec max
Time 25°C to Peak Temperature	6 min max.	8 min max.

Handling and Storage

Storage Conditions

Packages described in this document must be stored in sealed moisture barrier, anti-static bags. Shelf life in a sealed moisture barrier bag is 12 months at <40° C and 90% relative humidity (RH) J-STD-033 p.7.

Out-of-Bag Time Duration
After unpacking the device must be soldered to the PCB within 168 hours as listed in the J-STD-020B p.11 with factory conditions <30°C and 60% RH.

Baking
It is not necessary to re-bake the part if both conditions (storage conditions and out-of-bag condition) have been satisfied. Baking must be done if at least one of the conditions above have not been satisfied. The baking conditions are 125° C for 24 hours J-STD-033 p.8.

CAUTION: Tape and reel materials typically cannot be baked at the temperature described above. If out-of-bag exposure time is exceeded, parts must be baked for a longer time at low temperatures, or the parts must be re-reeled, de-taped, re-baked and then put back on tape and reel. (See moisture sensitive warning label on each shipping bag for information of baking)

Board Rework

Component Removal, Rework and Remount
If a component is to be removed from the board, it is recommended that localized heating be used and the maximum body temperatures of any surface mount component on the board not exceed 200° C. This method will minimize moisture related component damage. If any component temperature exceeds 200° C, the board must be baked dry per 4-2 prior to rework and/or component removal. Component temperatures **shall** be measured at the top center of the package body. Any SMD packages that have not exceeded their floor life can be exposed to a maximum body temperature as high as their specified maximum reflow temperature.

Removal for Failure Analysis
Not following the requirements of 4-1 may cause moisture/reflow damage that could hinder or completely prevent the determination of the original failure mechanism.

Baking of Populated Boards
Some SMD packages and board materials are not able to withstand long duration bakes at 125° C. Examples of this are some FR-4 materials, which cannot withstand a 24 hr bake at 125° C. Batteries and electrolytic capacitors are also temperature sensitive. With component and board temperature restrictions in mind, choose a bake temperature from Table 4-1 in J-STD 033; then determine the appropriate bake duration based on the component to be removed. For additional considerations see IPC-7711 and IPC-7721.

Derating due to Factory Environmental Conditions

Factory floor life exposures for SMD packages removed from the dry bags will be a function of the ambient environmental conditions. A safe, yet conservative, handling approach is to expose the SMD packages only up to the maximum time limits for each moisture sensitivity level as shown in Table 6. This approach, however, does not work if the factory humidity or temperature are greater than the testing conditions of 30° C/60% RH. A solution for addressing this problem is to derate the exposure times based on the knowledge of moisture diffusion in the component packaging materials (ref. JESD22-A120). Recommended equivalent total floor life exposures can be estimated for a range of humidity's and temperatures based on the nominal plastic thickness for each device. Table 8 lists equivalent derated floor lives for humidity's ranging from 20– 90% RH for three temperatures, 20° C, 25° C, and 30° C. This table is applicable to SMDs molded with novolac, biphenyl or multifunctional epoxy mold compounds. The following assumptions were used in calculating Table 8:

1. Activation Energy for diffusion = 0.35eV (smallest known value).
2. For ≤60% RH, use Diffusivity = 0.121exp (- 0.35eV/kT) mm2/s (this uses smallest known Diffusivity @ 30° C).
3. For >60% RH, use Diffusivity = 1.320exp (- 0.35eV/kT) mm2/s (this uses largest known Diffusivity @ 30° C).

Table 8. Recommended Equivalent Total Floor Life (days) @ 20°C, 25°C & 30°C For ICs with Novolac, Biphenyl and Multifunctional Epoxies (Reflow at same temperature at which the component was classified)
