## 74ALVC162827

### Low Voltage 20-Bit Buffer/Line Driver with 3.6V Tolerant Inputs and Outputs and 26Ω Series Resistors in the Outputs

#### General Description

The ALVC162827 contains twenty non-inverting buffers with 3-STATE outputs to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver. The device is byte controlled. Each byte has NOR output enables for maximum control flexibility.

The 74ALVC162827 is designed for low voltage (1.65V to 3.6V)  $V_{CC}$  applications with I/O capability up to 3.6V. The ALVC162827 is also designed with 26Ω resistors in the outputs.

The 74ALVC162827 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### Features

- 1.65V to 3.6V  $V_{CC}$  supply operation
- 3.6V tolerant inputs and outputs
- 26Ω series resistors in outputs
- $t_{PD}$ 
  - 3.9 ns max for 3.0V to 3.6V  $V_{CC}$
  - 4.6 ns max for 2.3V to 2.7V  $V_{CC}$
  - 8.2 ns max for 1.65V to 1.95V  $V_{CC}$
- Power-off high impedance inputs and outputs
- Supports live insertion and withdrawal (Note 1)
- Uses patented noise/EMI reduction circuitry
- Latchup conforms to JEDEC JED78
- ESD performance:
  - Human body model > 2000V
  - Machine model > 200V

**Note 1:** To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pull-up resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

### Functional Description

The 74ALVC162827 contains twenty non-inverting buffers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of each other. The control pins may be shorted together to obtain full 20-bit operation. The 3-STATE outputs are controlled by Output Enable ( $\overline{OE}_n$ ) inputs. When  $\overline{OE}_1$ , and  $\overline{OE}_2$  are LOW,  $O_0-O_{10}$  are in the 2-state mode. When either  $\overline{OE}_1$  or  $\overline{OE}_2$  are HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the inputs. The same applies for byte two with  $\overline{OE}_3$  and  $\overline{OE}_4$ .
