

ADS8284

18-BIT, 1-MSPS, PSEUDO-BIPOLAR DIFFERENTIAL SAR ADC WITH ON-CHIP ADC DRIVER (OPA) AND 4-CHANNEL DIFFERENTIAL MULTIPLEXER

FEATURES

- 1.0-MHz Sample Rate, Zero Latency at Full Speed
- 18-Bit Resolution
- Supports Pseudo-Bipolar Differential Input Range: -4 V to +4 V with 2-V Common-Mode
- Built-In Four Channel, Differential Ended Multiplexer; with Channel Count Selection and Auto/Manual Mode
- On-Board Differential ADC Driver (OPA)
- Buffered Reference Output to Level Shift Bipolar ±4-V Input with External Resistance Divider
- Reference/2 Output to Set Common-Mode for External Signal Conditioner
- 18-/16-/8-Bit Parallel Interface
- SNR: 98.4dB Typ at 2-kHz I/P
- THD: -119dB Typ at 2-kHz I/P
- Power Dissipation: 331.25 mW at 1 MSPS Including ADC Driver
- Internal Reference
- Internal Reference Buffer
- 64-Pin QFN Package

APPLICATIONS

- Medical Imaging/CT Scanners
- Automated Test Equipment
- High-Speed Data Acquisition Systems
- High-Speed Closed-Loop Systems

DESCRIPTION

The ADS8284 is a high-performance analog system-on-chip (SoC) device with an 18-bit, 1-MSPS A/D converter, 4-V internal reference, an on-chip ADC driver (OPA), and a 4-channel differential multiplexer. The channel count of the multiplexer and auto/manual scan modes of the device are user selectable.

The ADC driver is designed to leverage the very high noise performance of the differential ADC at optimum power usage levels.

The ADS8284 outputs a buffered reference signal for level shifting of a ±4-V bipolar signal with an external resistance divider. A V_{ref}/2 output signal is available to set the common-mode of a signal conditioning circuit. The device also includes an 18-/16-/8-bit parallel interface.

The ADS8284 is available in a 9 mm x 9 mm, 64-pin QFN package and is characterized from -40°C to 85°C.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

DEVICE OPERATION AND TIMING DIAGRAMS

The ADS8284 is analog system-on-chip (SoC) device. The device includes a multiplexer, a differential input/differential output ADC driver and differential input high-performance ADC, an additional internal reference, a buffered reference output, and a REF/2 output.

Figure 1 shows the basic operation of the device (including all elements). Subsequent sections describe the detailed timings of the individual blocks of the device (primarily the multiplexer and ADC).

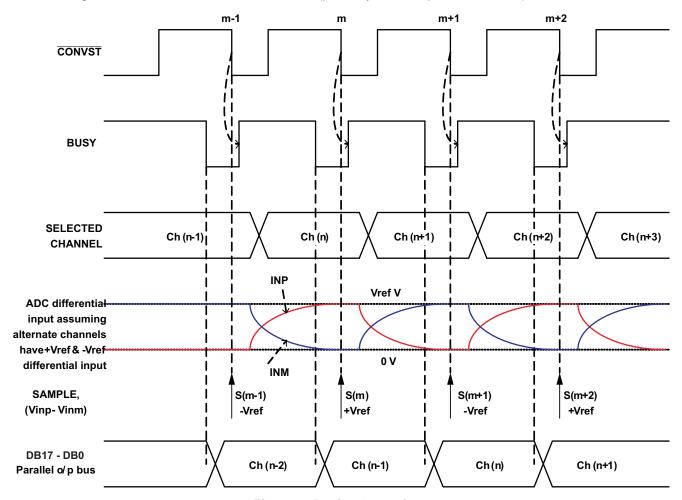

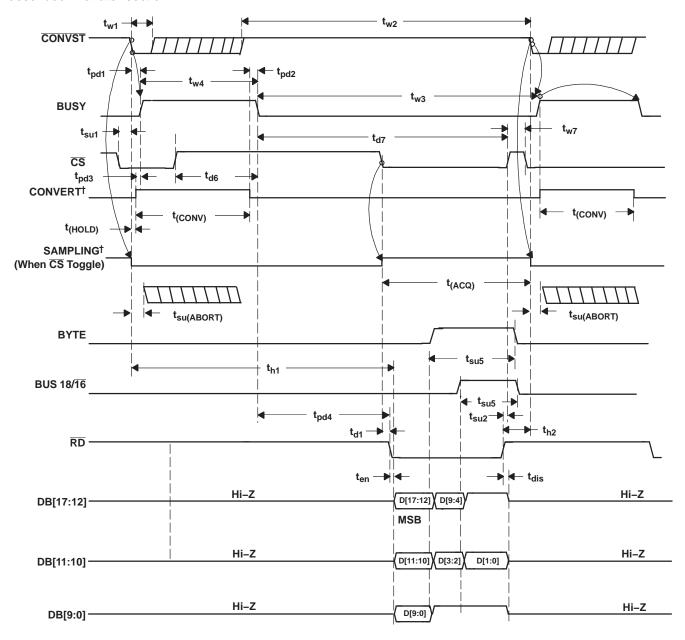

Figure 1. Device Operation

As shown in the diagram, the device can be controlled with only one (CONVST) digital input. On the falling edge of CONVST, the BUSY output of the device goes high. A high level on BUSY indicates the device has sampled the signal and it is converting the sample into its digital equivalent. After the conversion is complete, the BUSY output falls to a logic low level and the device output data corresponding to the recently converted sample is available for reading.

It is recommended (not mandatory) to short the BUSY output of the device to the MXCLK input. The device selects a new channel at every rising edge of MXCLK. The multiplexer is differential. The multiplexer and ADC driver are designed to settle to the 18-bit level before sampling; even at the maximum conversion speed.

ADC control and timing: The timing diagrams in this section describe ADC operation; multiplexer operation is described in a later section.

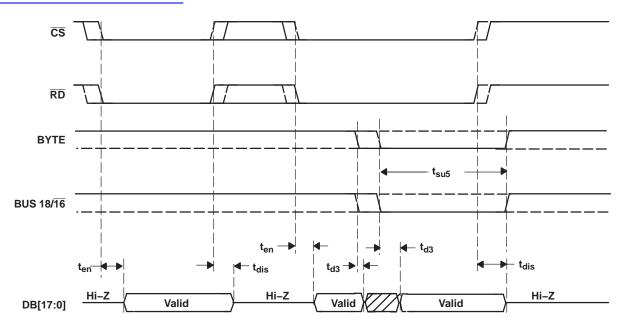

Figure 6. Detailed Timing for Read Cycles

Multiplexer: The multiplexer has two modes of sequencing namely auto sequencing and manual sequencing. Multiplexer mode selection and operation is controlled with the AUTO, C1, C2, C3, and MXCLK pins.

Auto sequencing: A logic one level on the AUTO pin selects auto sequencing mode. It is possible to select the number of channels to be scanned (always starting from channel zero) in auto sequencing mode. Pins C1 and C2 select the channel count (last channel in the auto sequence).

On every rising edge of MXCLK while C3 is at the logic zero level, the next higher channel (in ascending order) is selected. Channel selection rolls over to channel zero on the rising edge of MXCLK after channel selection reaches the *channel count* (last channel in the auto sequence selected by pins C1 and C2).

Any time during the sequence the channel sequence can be reset to channel zero. A rising edge on MXCLK while C3 is at the logic one level resets channel selection to channel zero.

APPLICATION INFORMATION

As discussed before, the ADS8284 is 18-bit analog SoC that includes various blocks like a multiplexer, ADC driver, internal reference, internal reference buffer, buffered reference output, and Ref/2 output on-board. The following diagram shows the recommended analog and digital interfacing of the ADS8284.

APPLICATION DIAGRAM

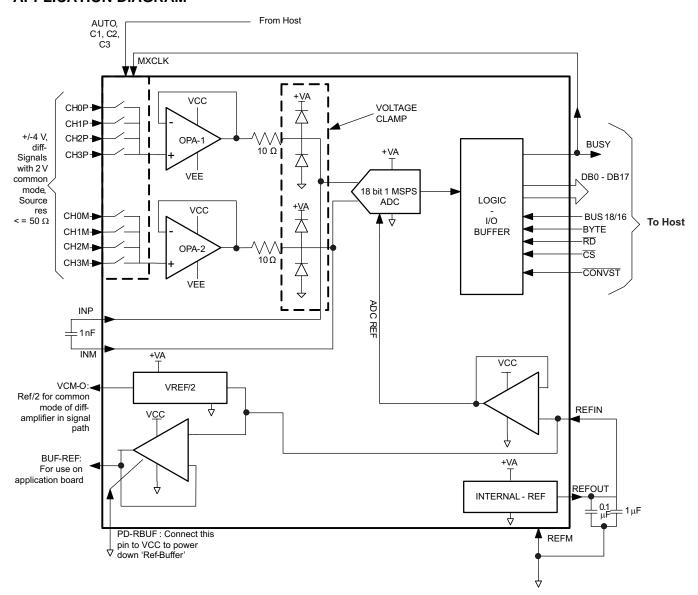

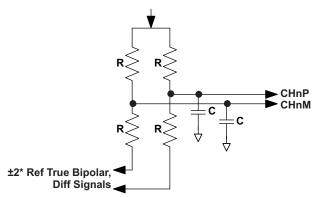

Figure 70. Analog and Digital Interface Diagram

As shown in Figure 70, the ADS8284 accepts unipolar differential analog inputs in the range of $\pm V_{ref}$ with a common-mode voltage of $V_{ref}/2$ (0 to V_{ref} at positive input and V_{ref} to 0 at negative input). An application may require the interfacing of true bipolar input signals. Figure 71 shows the conversion of bipolar input signals to unipolar differential signals.

From BUF-REF o/p of ADC (Use external buffer if current drawn by resistor network exceeds current output specification of reference buffer)

Note: Value of R depends on signal BW Use R = 1.2 k Ω for signal BW <= 10 kHz. Choose C as per signal BW, 3 dB BW (filt) = RC/2

Figure 71. Conversion of Bipolar Input Signals to Unipolar Differential Signals

MICROCONTROLLER INTERFACING

ADS8284 to 8-Bit Microcontroller Interface

Figure 72 shows a parallel interface between the ADS8284 and a typical microcontroller using an 8-bit data bus. The BUSY signal is used as a falling edge interrupt to the microcontroller.

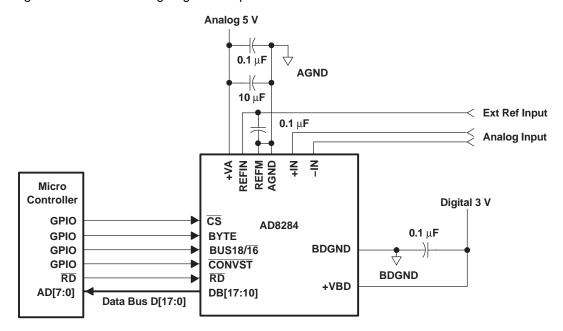

Figure 72. ADS8284 Application Circuitry

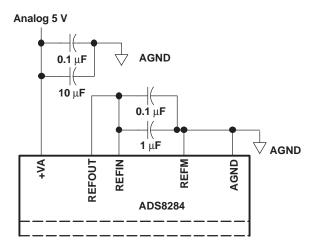

Figure 73. ADS8284 Using Internal Reference

PRINCIPLES OF OPERATION

The ADS8284 features a high-speed successive approximation register (SAR) analog-to-digital converter (ADC). The architecture is based on charge redistribution which inherently includes a sample/hold function. See Figure 72 for the application circuit for the ADS8284.

The conversion clock is generated internally. The conversion time of 650 ns is capable of sustaining a 1 MHz throughput.

The analog input voltage to ADC is provided to two input pins AINP and AINM. When a conversion is initiated, the differential input on these pins is sampled on the internal capacitor array. While a conversion is in progress, both inputs are disconnected from any internal function.

REFERENCE

The ADS8284 can operate with an external reference with a range from 3.0 V to 4.2 V. The reference voltage on the input pin 10 (REFIN) of the converter is internally buffered. A clean, low noise, well-decoupled reference voltage on this pin is required to ensure good performance of the converter. A low noise band-gap reference like the REF5040 can be used to drive this pin. A 0.1- μ F decoupling capacitor is required between REFIN and REFM pins (pin 10 and pin 9) of the converter. This capacitor should be placed as close as possible to the pins of the device. Designers should strive to minimize the routing length of the traces that connect the terminals of the capacitor to the pins of the converter. An RC network can also be used to filter the reference voltage. A 100- Ω series resistor and a 0.1- μ F capacitor, which can also serve as the decoupling capacitor can be used to filter the reference voltage.

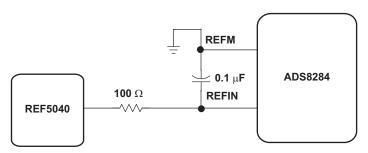

Figure 74. ADS8284 Using External Reference

The ADS8284 also has limited low pass filtering capability built into the converter. The equivalent circuitry on the REFIN input is as shown in Figure 75.

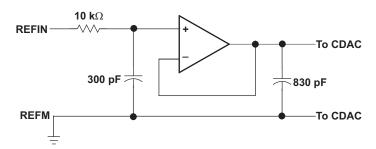

Figure 75. Simplified Reference Input Circuit

The REFM input of the ADS8284 should always be shorted to AGND. A 4.096-V internal reference is included. When the internal reference is used, pin 11 (REFOUT) is connected to pin 10 (REFIN) with an 0.1- μ F decoupling capacitor and 1- μ F storage capacitor between pin 11 (REFOUT) and pin 9 (REFM) (see Figure 73). The internal reference of the converter is double buffered. If an external reference is used, the second buffer provides isolation between the external reference and the CDAC. This buffer is also used to recharge all of the capacitors of the CDAC during conversion (see Figure 75). Pin 11 (REFOUT) can be left unconnected (floating) if external reference is used.

ANALOG INPUT

The device features an analog multiplexer, a differential, high input impedance, unity gain ADC driver, and a high performance ADC. Typically alot of care is required for driving circuit component selection and board layout for high resolution ADC driving. However an on-board ADC driver simplifies the job for the user. All that is required is to decouple AINP and AINM with a 1-nF decoupling capacitor across these two terminals as close to the device as possible. The multiplexer inputs tolerate source impedance of up to 50 Ω for specified device performance at an operating speed of 1-MSPS. This relaxes constraints on the signal conditioning circuit. In the case of true bipolar input signals, it is possible to condition them with a resister divider as shown in Figure 71. The device permits use of 1.2-k Ω resistors for the divider with effective source impedance of 600 Ω for signal bandwidth less than 10 kHz. A suitable capacitor value used to limit signal bandwidth limits noise coming from the resistor divider network. Care must be taken concerning absolute analog voltage at the multiplexer input terminals. This voltage should not exceed VCC and VEE. The clamp at the driver OPA limits the voltage applied to the ADC input.

Reading Data

Zero

The ADS8284 outputs full parallel data in straight binary format as shown in Table 3. The parallel output is active when \overline{CS} and \overline{RD} are both low. There is a minimal quiet zone requirement around the falling edge of \overline{CONVST} . This is 50 ns prior to the falling edge of \overline{CONVST} and \overline{AD} ns after the falling edge. No data read should attempted within this zone. Any other combination of \overline{CS} and \overline{RD} sets the parallel output to 3-state. BYTE and BUS18/16 are used for multiword read operations. BYTE is used whenever lower bits on the bus are output on the higher byte of the bus. BUS18/16 is used whenever the last two bits on the 18-bit bus is output on either bytes of the higher 16-bit bus. Refer to Table 3 for ideal output codes.

DESCRIPTION ANALOG VALUE DIGITAL OUTPUT STRAIGHT BINARY Full scale range $2 \times (+V_{ref})$ Least significant bit (LSB) $2 \times (+V_{ref})/262144$ **BINARY CODE HEX CODE** +Full scale (+V_{ref}) - 1 LSB 01 1111 1111 1111 1111 1FFFF Midscale 0 V 00 0000 0000 0000 0000 00000 Midscale - 1 LSB 0 V - 1 LSB 3FFFF 11 1111 1111 1111 1111

Table 3. Ideal Input Voltages and Output Codes

The output data is a full 18-bit word (D17-D0) on DB17-DB0 pins (MSB-LSB) if both BUS18/ $\overline{16}$ and BYTE are low.

10 0000 0000 0000 0000

 $-V_{ref}$

The result may also be read on an 16-bit bus by using only pins DB17–DB2. In this case two reads are necessary: the first as before, leaving both BUS18/16 and BYTE low and reading the 16 most significant bits (D17–D2) on pins DB17–DB2, then bringing BUS18/16 high while holding BYTE low. When BUS18/16 is high, the lower two bits (D1–D0) appear on pins DB3–DB2.

The result may also be read on an 8-bit bus for convenience. This is done by using only pins DB17–DB10. In this case three reads are necessary: the first as before, leaving both BUS18/16 and BYTE low and reading the 8 most significant bits on pins DB17–DB10, then bringing BYTE high while holding BUS18/16 low. When BYTE is high, the medium bits (D9–D2) appear on pins DB17–DB10. The last read is done by bringing BUS18/16 high while holding BYTE high. When BUS18/16 is high, the lower two bits (D1–D0) appear on pins DB11–DB10. The last read cycle is not necessary if only the first 16 most significant bits are of interest.

All of these multiword read operations can be performed with multiple active \overline{RD} (toggling) or with \overline{RD} held low for simplicity. This is referred to as the AUTO READ operation.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL PAD MECHANICAL DATA

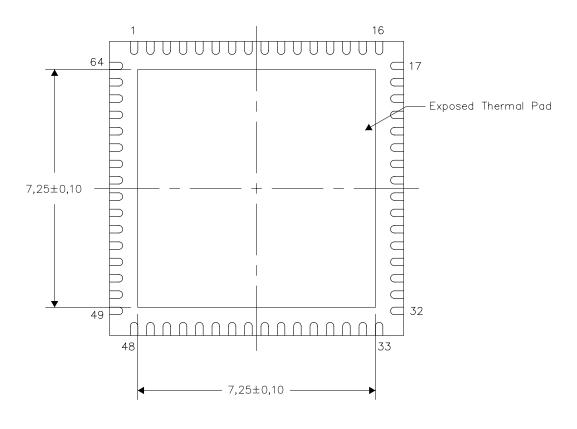

RGC (S-PVQFN-N64)

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No—Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
