## 74VCX16722 Low Voltage 22-Bit Register with 3.6V Tolerant Inputs and Outputs

#### **General Description**

The VCX16722 low voltage 22-bit register contains twentytwo non-inverting D-type flip-flops with 3-STATE outputs and is intended for bus oriented applications. The design has been optimized for use with JEDEC compliant 200 pin DIMM modules.

The 74VCX16722 is designed for low voltage (1.65V to 3.6V) V\_{CC} applications with I/O capability up to 3.6V.

The 74VCX16722 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### Jacpac

### Features

- 1.65V-3.6V V<sub>CC</sub> supply operation
- 3.6V tolerant inputs and outputs
- t<sub>PD</sub> (CLK to O<sub>n</sub>) 3.6ns max for 3.0V to 3.6V V<sub>CC</sub> 4.6ns max for 2.3V to 2.7V V<sub>CC</sub> 9.2ns max for 1.65V to 1.95V V<sub>CC</sub>
- Power-down high impedance inputs and outputs

February 1999

Revised November 2000

- Supports live insertion/withdrawal (Note 1)
- Meets JEDEC registered module specifications
- Static Drive (I<sub>OH</sub>/I<sub>OL</sub>) ±24mA @ 3.0V ±18mA @ 2.3V ±6mA @ 1.65V
- Latchup performance exceeds 300 mA
- ESD performance:
  - Human body model > 2000V

Machine model >200V

Note 1: To ensure the high-impedance state during power up or power down,  $\overline{\text{OE}}$  should be tied to  $V_{\text{CC}}$  through a pull-up resistor; the minimum value of the resistor is determined by the current sourcing capability of the driver.

#### **Ordering Code:**

| Order Number           | er Number Package Number Package Description |   |
|------------------------|--|---|
| 74VCX16722MTD          | MTD64  | 64-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide |
| Devices also available | in Tape and Reel. Specify                    | by appending the suffix letter "X" to the ordering code.                    |

 $\uparrow$  = LOW-to-HIGH Clock Transition

#### **Functional Description**

The VCX16722 contains twenty-two D-type flip-flops with 3-STATE standard outputs. The twenty-two flip-flops will store the state of their individual D-type inputs that meet the setup and hold time requirements on the LOW-HIGH Clock (CLK) transition, when the Clock-Enable (CE) is LOW. The 3-STATE standard outputs are controlled by the Output-Enable ( $\overline{OE}$ ). When  $\overline{OE}$  is HIGH, the standard outputs are in high impedance mode but this does not interfere with entering new data into the flip-flops.

#### Logic Diagram

# Absolute Maximum Ratings(Note 2) Recommended Operating

| Supply Voltage (V <sub>CC</sub> )              | -0.5V to +4.6V                      |
|--|-------------------------------------|
| DC Input Voltage (VI)                          | -0.5V to +4.6V                      |
| Output Voltage (V <sub>O</sub> )               |                                     |
| Outputs 3-STATE                                | -0.5V to +4.6V                      |
| Outputs Active (Note 3)                        | -0.5 V to V <sub>CC</sub> + $0.5 V$ |

| Operating  | 1.65V to 3.6V                  |
| Data Retention Only  | 1.2V to 3.6V                   |
| Input Voltage  | -0.3V to 3.6V                  |
| Output Voltage (V <sub>O</sub> )                                       |                                |
| Output in Active States  | 0V to V <sub>CC</sub>          |
| Output in 3-STATE  | 0V to 3.6V                     |
| Output Current in I <sub>OH</sub> /I <sub>OL</sub>                     |                                |
| $V_{CC} = 3.0V$ to 3.6V  | ±24 mA                         |
| $V_{CC} = 2.3V$ to 2.7V  | ±18 mA                         |
| V <sub>CC</sub> = 1.65V to 2.3V  | ±6 mA                          |
| Free Air Operating Temperature (T <sub>A</sub> )                       | $-40^\circ C$ to $+85^\circ C$ |
| Minimum Input Edge Rate ( $\Delta t/\Delta V$ )                        |                                |
| $V_{\text{IN}} = 0.8 \text{V}$ to 2.0V, $V_{\text{CC}} = 3.0 \text{V}$ | 10 ns/V                        |

74VCX16722

Note 2: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The Recommended Operating Conditions tables will define the conditions for actual device operation.

Note 3:  $I_O$  Absolute Maximum Rating must be observed.

Note 4: Floating or unused pin (inputs or I/O's) must be held HIGH or LOW.

| <sup>t</sup> oshl<br><sup>t</sup> oslh | Output to Output Skew<br>(Note 9) |  | 0.5 |                                       | 0.5 |                      | 0.75 | ns    |

Note 8: For  $C_L$ = 50 pF, add approximately 300 ps to the AC maximum specification.

Note 9: Skew is defined as the absolute value of the difference between the actual propagation delay for any two separate outputs of the same device. The specification applies to any outputs switching in the same direction, either HIGH-to-LOW ( $t_{OSHL}$ ) or LOW-to-HIGH ( $t_{OSLH}$ ).
