

FEATURES

- Green-mode PWM
- Supports the “Blue Angel” standard
- Low start-up current (10 μ A)
- Low operating current (2.5mA)
- Leading-edge blanking
- Constant output power limit
- Universal input
- Built-in synchronized slope compensation
- Current-mode operation
- Cycle-by-cycle current limiting
- Under voltage lockout (UVLO)
- Programmable PWM frequency
- V_{DD} over-voltage protection (auto restart)
- Gate output voltage clamped at 17V
- Low cost
- Few external components required
- Small SOT-26 and DIP-8 packages

APPLICATIONS

General-purpose, switching-mode power supplies and flyback power converters, such as:

- Battery chargers for cellular phones, cordless phones, PDAs, digital cameras, and power tools
- Power adapters for ink jet printers, video game consoles, and portable audio players
- Open-frame SMPS for TV/DVD standby and auxiliary supplies, home appliances, and consumer electronics
- Replacements for linear transformers and RCC SMPS
- PC 5V standby power

DESCRIPTION

This highly integrated PWM controller provides several special enhancements designed to meet the low standby power needs of low-power SMPS. To minimize standby power consumption, the proprietary green-mode function provides off-time modulation to linearly decrease the switching frequency under light-load conditions. This green-mode function enables the power supply to meet even the strictest power conservation requirements.

The BiCMOS fabrication process enables reducing the start-up current to 10 μ A and the operating current to 2.5mA. To further improve power conservation, a large start-up resistance can be used. Built-in synchronized slope compensation ensures the stability of peak current mode control. Proprietary internal compensation provides a constant output power limit over a universal AC input range (90V_{AC} to 264V_{AC}). Pulse-by-pulse current limiting ensures safe operation even during short-circuits.

To protect the external power MOSFET from being damaged by supply over-voltage events, the SG6858's output driver is clamped at 17V. SG6858 controllers can be used to improve the performance and reduce the production cost of power supplies and can replace linear and RCC-mode power adapters. It is available in 8-pin DIP and 6-pin SOT-26 packages.

PIN CONFIGURATION

ORDERING INFORMATION

Part Number	Pb-Free	Package
SG6858TZ		6-pin SOT-26
SG6858DZ		8-pin DIP-8

PIN DESCRIPTIONS

Name	Pin No.		Type	Function
	DIP-8	SOT-26		
GATE	1	6	Driver Output	The totem-pole output driver for driving the power MOSFET.
VDD	2	5	Supply	Power supply.
NC	3		No Connection	NC pin.
SENSE	4	4	Analog Input	Current sense. This pin senses the voltage across a resistor. When the voltage reaches the internal threshold, PWM output is disabled. This activates over-current protection. This pin also provides current amplitude information for current-mode control.
RI	5	3	Analog Input/Output	A resistor connected from the RI pin to ground generates a constant current source used to charge an internal capacitor and determines the switching frequency. Increasing the resistance reduces the amplitude of the current source and reduce the switching frequency. A 95kΩ resistor, R _i , results in a 50μA constant current I _i and a 70kHz switching frequency.
NC	6		No Connection	NC pin.
FB	7	2	Analog Input	Feedback. The FB pin provides the output voltage regulation signal. It provides feedback to the internal PWM comparator, so that the PWM comparator can control the duty cycle.
GND	8	1	Supply	Ground.

BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _{VDD}	DC Supply Voltage*	30	V
V _{FB}	Input Voltage to FB Pin	-0.3 to 7.0	V
V _{SENSE}	Input Voltage to Sense Pin	-0.3 to 7.0	V
T _J	Operating Junction Temperature	-40 to +125	°C
R _{θ JA}	Thermal Resistance (Junction-to-Air)	SOT	208.4 °C/W
		DIP	82.5 °C/W
T _{STG}	Storage Temperature Range	-55 to +150	°C
T _L	Lead Temperature (Wave Soldering or Infrared, 10 Seconds)	260	°C
V _{ESD-HBM}	Electrostatic Discharge Capability, Human Body Model	3.0	kV
V _{ESD-MM}	Electrostatic Discharge Capability, Machine Model	200	V

* All voltage values, except differential voltages, are given with respect to GND pin.

* Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V _{DD}	DC Supply Voltage	≤ 22	V
T _A	Operating Ambient Temperature	-20 to +85	°C

* For proper operation.

ELECTRICAL CHARACTERISTICS

V_{DD}=15V, T_A = 25°C, unless otherwise noted.

V_{DD} Section

$V_{GATE-CLAMP}$	Output Clamp Voltage	$V_{DD}=22V$	16	17	18	V

TYPICAL CHARACTERISTICS

OPERATION DESCRIPTION

SG6858 devices integrate many useful designs into one controller for low-power switch-mode power supplies. The following descriptions highlight some of the features of the SG6858 series.

Start-up Current

The start-up current is only 10 μ A, which allows a start-up resistor with a high resistance and a low-wattage to supply the start-up power for the controller. A 1.5M Ω , 0.25W, start-up resistor and a 10 μ F/25V V_{DD} hold-up capacitor are sufficient for an AC-to-DC power adapter with a wide input range (100V_{AC} to 240V_{AC}).

Operating Current

The operating current has been reduced to 2.5mA. The low operating current results in higher efficiency and reduces the V_{DD} hold-up capacitance requirement.

Green-Mode Operation

The proprietary green-mode function provides off-time modulation to linearly decrease the switching frequency under light-load conditions. On-time is limited to provide stronger protection against brownouts and other abnormal conditions. The feedback current, which is sampled from the voltage feedback loop, is taken as the reference. Once the feedback current exceeds the threshold current, the switching frequency starts to decrease. This green-mode function dramatically reduces power consumption under light-load and zero-load conditions. Power supplies using the SG6858 can meet even the strictest regulations regarding standby power consumption.

Oscillator Operation

A resistor connected from the RI pin to ground generates a constant current source used to charge an internal capacitor. The charge-time determines the internal clock speed and the switching frequency. Increasing the resistance reduces the amplitude of the input current and the switching frequency. A 95k Ω resistor, R_I , results in a 50 μ A constant current, I_I , and a 70kHz switching

frequency. The relationship between R_I and the switching frequency is:

$$f_{PWM} = \frac{6650}{R_I \text{ (k}\Omega\text{)}} \text{ (kHz)} \quad (1)$$

Leading-Edge Blanking

Each time the power MOSFET is switched on, a turn-on spike occurs at the sense-resistor. To avoid premature termination of the switching pulse, a 300ns leading-edge blanking time is built in. Conventional RC filtering can therefore be omitted. During this blanking period, the current-limit comparator is disabled and cannot switch off the gate driver.

Constant Output Power Limit

When the SENSE voltage across the sense resistor, R_S , reaches the threshold voltage (around 0.96V), the output GATE drive is turned off following a short propagation delay t_{PD} .

This propagation delay introduces additional current proportional to $t_{PD} \cdot V_{in} / L_p$. The propagation delay is nearly constant regardless of the input line voltage V_{IN} . Higher input line voltages result in larger additional currents. At high input line voltages, the output power limit is higher than at low input line voltages.

To compensate for this output power limit variation across a wide AC input range, the threshold voltage is adjusted by adding a positive ramp (V_{LIMIT_RAMP}).

This ramp signal rises from 0.80V to 0.96V, then flattens out at 0.96V. A smaller threshold voltage forces the output GATE drive to terminate earlier. This reduces the total PWM turn-on time and makes the output power equal to that of low line input. This proprietary internal compensation ensures a constant output power limit for a wide AC input voltage range (90V_{AC} to 264V_{AC}).

Under-Voltage Lockout (UVLO)

The turn-on and turn-off thresholds of the SG6858 are fixed internally at 16.5V/11.5V. During start-up, the hold-up capacitor must be charged to 16.5V through the start-up resistor to enable SG6858. The hold-up capacitor continues to supply V_{DD} until power can be delivered from the auxiliary winding of the main transformer. V_{DD} must not drop below 11.5V during this start-up process. This UVLO hysteresis window ensures that hold-up capacitor is adequate to supply V_{DD} during start-up.

V_{DD} Over-Voltage Protection

V_{DD} over-voltage protection has been built in to prevent damage due to over-voltage conditions. When the voltage V_{DD} exceeds the internal threshold due to abnormal conditions, PWM output is turned off until the V_{DD} voltage drops below the UVLO, then starts up again. Over-voltage conditions are usually caused by open-feedback loops.

Gate Output

The BiCMOS output stage is a fast totem pole gate driver. Cross conduction has been avoided to minimize heat dissipation, increase efficiency, and enhance reliability. The output driver is clamped by an internal 17V Zener diode to protect power MOSFET transistors against undesired over-voltage gate signals.

Built-in Slope Compensation

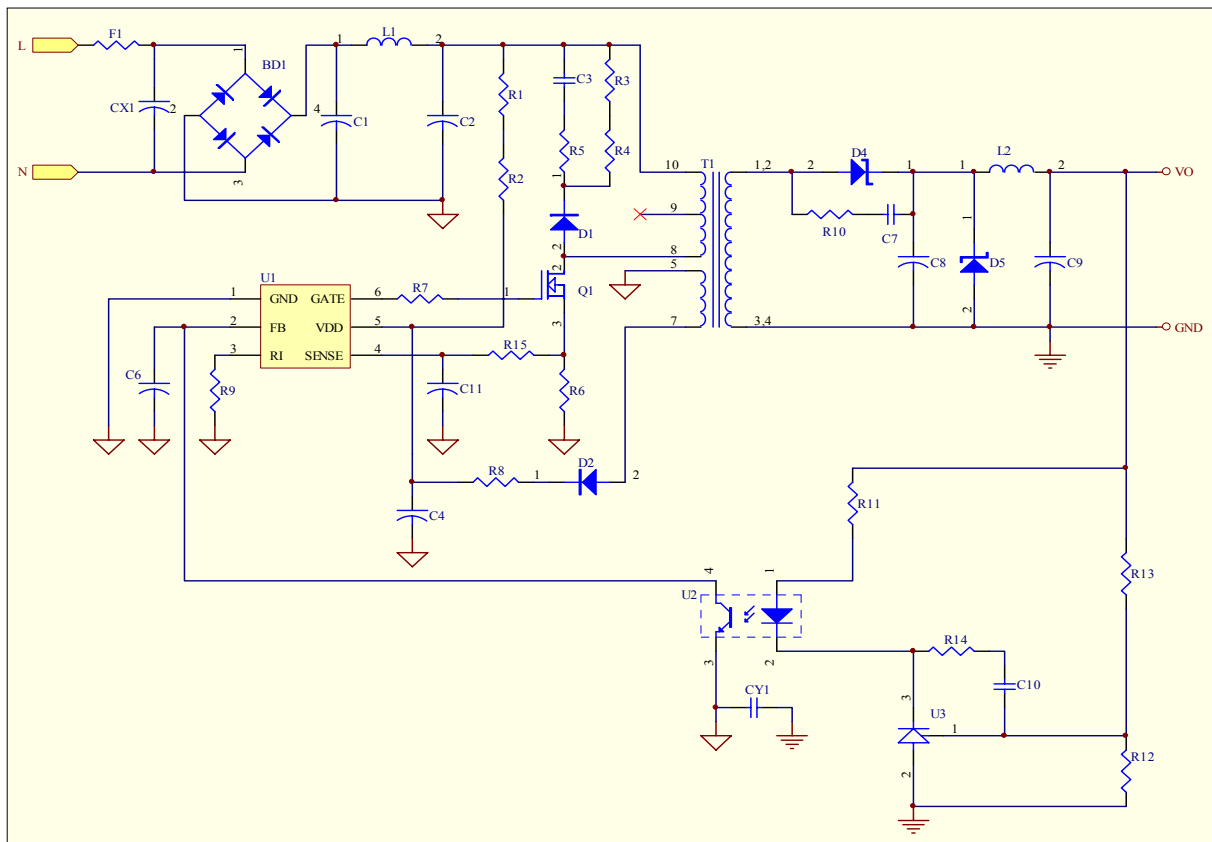

The sensed voltage across the current sense resistor is used for current-mode control and pulse-by-pulse current limiting. Built-in slope compensation improves stability and prevents sub-harmonic oscillations due to peak-current mode control. The SG6858 has a synchronized, positively-sloped ramp built-in at each switching cycle. The slope of the ramp is:

$$\frac{0.36 \times \text{Duty}}{\text{Duty}(\text{max.})} \quad (2)$$

Noise Immunity

Noise from the current sense or the control signal can cause significant pulse width jitter, particularly in continuous-conduction mode. While slope compensation helps alleviate these problems, further precautions should still be taken. Good placement and layout practices should be followed. Avoiding long PCB traces and component leads, locating compensation and filter components near the SG6858, and increasing the power MOS gate resistance improves performance.
