

# LM4051

## Precision Micropower Shunt Voltage Reference

### General Description

Ideal for space critical applications, the LM4051 precision voltage reference is available in the sub-miniature (3 mm x 1.3 mm) SOT-23 surface-mount package. The LM4051's advanced design eliminates the need for an external stabilizing capacitor while ensuring stability with any capacitive load, thus making the LM4051 easy to use. Further reducing design effort is the availability of a fixed (1.225V) and adjustable reverse breakdown voltage. The minimum operating current is 60  $\mu$ A for the LM4051-1.2 and the LM4051-ADJ. Both versions have a maximum operating current of 12 mA.

The LM4051 comes in three grades (A, B, and C). The best grade devices (A) have an initial accuracy of 0.1%, while the B-grade have 0.2% and the C-grade 0.5%, all with a tempco of 50 ppm/ $^{\circ}$ C guaranteed from  $-40^{\circ}$ C to  $125^{\circ}$ C.

The LM4051 utilizes fuse and zener-zap trim of reference voltage during wafer sort to ensure that the prime parts have an accuracy of better than  $\pm 0.1\%$  (A grade) at  $25^{\circ}$ C.

### Features

- Small packages: SOT-23
- No output capacitor required
- Tolerates capacitive loads
- Reverse breakdown voltage options of 1.225V and adjustable

### Key Specifications (LM4051-1.2)

- Output voltage tolerance (A grade,  $25^{\circ}$ C)  $\pm 0.1\%$ (max)

- Low output noise (10 Hz to 10kHz)  $20\mu V_{rms}$
- Wide operating current range  $60\mu A$  to  $12mA$
- Industrial temperature range  $-40^{\circ}C$  to  $+85^{\circ}C$
- Extended temperature range  $-40^{\circ}C$  to  $+125^{\circ}C$
- Low temperature coefficient  $50 ppm/^{\circ}C$  (max)

### Applications

- Portable, Battery-Powered Equipment
- Data Acquisition Systems
- Instrumentation
- Process Control
- Energy Management
- Automotive and Industrial
- Precision Audio Components
- Base Stations
- Battery Chargers
- Medical Equipment
- Communication

## LM4051-ADJ (Adjustable)

### Electrical Characteristics (Continued)

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

**Note 2:** The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{Jmax}$  (maximum junction temperature),  $\theta_{JA}$  (junction to ambient thermal resistance), and  $T_A$  (ambient temperature). The maximum allowable power dissipation at any temperature is  $PD_{max} = (T_{Jmax} - T_A)/\theta_{JA}$  or the number given in the Absolute Maximum Ratings, whichever is lower. For the LM4051,  $T_{Jmax} = 125^\circ\text{C}$ , and the typical thermal resistance ( $\theta_{JA}$ ), when board mounted, is  $280^\circ\text{C/W}$  for the SOT-23 package.

**Note 3:** The human body model is a 100 pF capacitor discharged through a 1.5 k $\Omega$  resistor into each pin. The machine model is a 200 pF capacitor discharged directly into each pin.

**Note 4:** Typical values are at  $T_J = 25^\circ\text{C}$  and represent most likely parametric norm.

**Note 5:** Limits are 100% production tested at  $25^\circ\text{C}$ . Limits over temperature are guaranteed through correlation using Statistical Quality Control (SQC) methods. The limits are used to calculate National's AOQL.

**Note 6:** The boldface (over-temperature) limit for Reverse Breakdown Voltage Tolerance is defined as the room temperature Reverse Breakdown Voltage Tolerance  $\pm[(\Delta V_R/\Delta T)(\max \Delta T)(V_R)]$ . Where,  $\Delta V_R/\Delta T$  is the  $V_R$  temperature coefficient,  $\max \Delta T$  is the maximum difference in temperature from the reference point of  $25^\circ\text{C}$  to  $T_{MAX}$  or  $T_{MIN}$ , and  $V_R$  is the reverse breakdown voltage. The total over-temperature tolerance for the different grades in the industrial temperature range where  $\max \Delta T = 65^\circ\text{C}$  is shown below:

A-grade:  $\pm 0.425\% = \pm 0.1\% \pm 50 \text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

B-grade:  $\pm 0.525\% = \pm 0.2\% \pm 50 \text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

C-grade:  $\pm 0.825\% = \pm 0.5\% \pm 50 \text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

Therefore, as an example, the A-grade LM4051-1.2 has an over-temperature Reverse Breakdown Voltage tolerance of  $\pm 1.2\text{V} \times 0.425\% = \pm 5.2 \text{ mV}$ .

**Note 7:** When  $V_{OUT} \leq 1.6\text{V}$ , the LM4051-ADJ in the SOT-23 package must operate at reduced  $I_R$ . This is caused by the series resistance of the die attach between the die (-) output and the package (-) output pin. See the Output Saturation curve in the Typical Performance Characteristics section.

**Note 8:** Reference voltage and temperature coefficient will change with output voltage. See Typical Performance Characteristics curves.

**Note 9:** Long term stability is  $V_R$  @  $25^\circ\text{C}$  measured during 1000 hrs.

**Note 10:** Thermal hysteresis is defined as the difference in voltage measured at  $+25^\circ\text{C}$  after cycling to temperature  $-40^\circ\text{C}$  and the  $25^\circ\text{C}$  measurement after cycling to temperature  $+125^\circ\text{C}$ .

## Applications Information

The LM4051 is a precision micro-power curvature-corrected bandgap shunt voltage reference. For space critical applications, the LM4051 is available in the sub-miniature SOT-23 surface-mount package. The LM4051 has been designed for stable operation without the need of an external capacitor connected between the “+” pin and the “-” pin. If, however, a bypass capacitor is used, the LM4051 remains stable. Design effort is further reduced with the choice of either a fixed 1.2V or an adjustable reverse breakdown voltage. The minimum operating current is 60  $\mu$ A for the LM4051-1.2 and the LM4051-ADJ. Both versions have a maximum operating current of 12 mA.

LM4051s using the SOT-23 package have pin 3 connected as the (-) output through the package’s die attach interface. Therefore, the LM4051-1.2’s pin 3 must be left floating or connected to pin 2 and the LM4051-ADJ’s pin 3 is the (-) output.

The typical thermal hysteresis specification is defined as the change in +25°C voltage measured after thermal cycling. The device is thermal cycled to temperature -40°C and then measured at 25°C. Next the device is thermal cycled to temperature +125°C and again measured at 25°C. The resulting  $V_{OUT}$  delta shift between the 25°C measurements is thermal hysteresis. Thermal hysteresis is common in precision references and is induced by thermal-mechanical package stress. Changes in environmental storage temperature, operating temperature and board mounting temperature are all factors that can contribute to thermal hysteresis.

In a conventional shunt regulator application (*Figure 1*), an external series resistor ( $R_S$ ) is connected between the supply voltage and the LM4051.  $R_S$  determines the current that flows through the load ( $I_L$ ) and the LM4051 ( $I_Q$ ). Since load current and supply voltage may vary,  $R_S$  should be small enough to supply at least the minimum acceptable  $I_Q$  to the

LM4051 even when the supply voltage is at its minimum and the load current is at its maximum value. When the supply voltage is at its maximum and  $I_L$  is at its minimum,  $R_S$  should be large enough so that the current flowing through the LM4051 is less than 12 mA.

$R_S$  should be selected based on the supply voltage, ( $V_S$ ), the desired load and operating current, ( $I_L$  and  $I_Q$ ), and the LM4051’s reverse breakdown voltage,  $V_R$ .

$$R_S = \frac{V_S - V_R}{I_L + I_Q}$$

The LM4051-ADJ’s output voltage can be adjusted to any value in the range of 1.24V through 10V. It is a function of the internal reference voltage ( $V_{REF}$ ) and the ratio of the external feedback resistors as shown in *Figure 2*. The output voltage is found using the equation

$$V_O = V_{REF}[(R_2/R_1) + 1] \quad (1)$$

$$R_S = \frac{V_S - V_R}{I_L + I_Q + I_F} \quad (2)$$

where  $V_O$  is the output voltage. The actual value of the internal  $V_{REF}$  is a function of  $V_O$ . The “corrected”  $V_{REF}$  is determined by

$$V_{REF} = V_O (\Delta V_{REF}/\Delta V_O) + V_Y \quad (3)$$

where

$$V_Y = 1.22V$$

$\Delta V_{REF}/\Delta V_O$  is found in the Electrical Characteristics and is typically -1.55 mV/V. You can get a more accurate indication of the output voltage by replacing the value of  $V_{REF}$  in equation (1) with the value found using equation (3).

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

### BANNED SUBSTANCE COMPLIANCE

National Semiconductor manufactures products and uses packing materials that meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
