NB7L32M

2.5V/3.3V, 14GHz ÷2 Clock Divider w/CML Output and Internal Termination

ON Semiconductor®

Descriptions

The NB7L32M is an integrated ÷2 divider with differential clock inputs and asynchronous reset.

Differential clock inputs incorporate internal 50 Ω termination resistors and accept LVPECL (Positive ECL), CML, or LVDS. The high frequency reset pin is asserted on the rising edge. Upon power−up, the internal flip−flops will attain a random state; the reset allows for the synchronization of multiple NB7L32M's in a system.

The differential 16 mA CML output provides matching internal 50 Ω termination which guarantees 400 mV output swing when externally receiver terminated 50 Ω to V_{CC} (See Figure 16).

The device is housed in a small 3x3 mm 16 pin QFN package.

11. Additive RMS jitter with 50% duty cycle input clock signal.
12. Device–to–device skew is measured between outputs under identical transition @ 1 GHz.

APPLICATION INFORMATION

All NB7L32M inputs can accept PECL, CML, and LVDS signal levels. The limitations for differential input signal (LVDS, PECL, or CML) are minimum input swing of 150 mV and the maximum input swing of 2500 mV. Within these conditions, the input voltage can range from V_{CC} to 1.2 V. Examples interfaces are illustrated below in a 50 Ω environment (Z = 50 Ω). For output termination and interface, refer to application note AND8020/D.
