

ASSP For Power Supply Applications (Secondary Battery) DC/DC Converter IC for Charging Li-ion Battery with Synchronous Rectifier

MB39A107

■ DESCRIPTION

The MB39A107 is a DC/DC converter IC suitable for down-conversion, using pulse-width modulation (PWM) charging and enabling output voltage to be set to any desired level from 1 cell to 4 cells.

The MB39A107 adopts output for Nch MOS drive of synchronous rectification type.

The MB39A107 can be used to monitor the current in an AC adapter or battery, as it contains a current amplifier that can set an offset voltage.

It can also be used for applications such as setting the charging voltages for 2 batteries.

The MB39A107 provides a broad power supply voltage range and low standby current as well as high efficiency, making it ideal for use as a built-in charging device in products such as notebook PC.

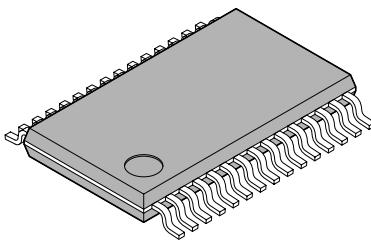

■ FEATURES

- Built-in low-current control circuits in two systems (supporting dynamically controlled charging)
- The charge current value can be analog controlled (+INE1 and +INE2 terminal)
- Built-in synchronous rectification system output for Nch MOS FET
- Built-in charge pump for driving high-side Nch MOS, providing 100% on-duty support
- Built-in AC adapter detection function
- Output voltage setting accuracy : $4.2\text{ V} \pm 0.74\%$ ($\text{Ta} = -10^\circ\text{C}$ to $+85^\circ\text{C}$)

■ PIN DESCRIPTION

Pin No.	Symbol	I/O	Descriptions
1	VCC	—	Reference voltage, control circuit power supply terminal
2	+ INUV	I	Low input voltage detection comparater (UV Comp.) input terminal
3	OUTC1	O	Current detection amplifier (Current Amp1) output terminal
4	– INC1	I	Current detection amplifier (Current Amp1) input terminal
5	+ INC1	I	Current detection amplifier (Current Amp1) input terminal
6	IOFA1	I	Current detection amplifier (Current Amp1) offset voltage input terminal
7	+ INE1	I	Error amplifier (Error Amp1) non-inverted input terminal
8	– INE1	I	Error amplifier (Error Amp1) inverted input terminal
9	FB1	O	Error amplifier (Error Amp1) output terminal
10	OUTC2	O	Current detection amplifier (Current Amp2) output terminal
11	– INC2	I	Current detection amplifier (Current Amp2) input terminal
12	+ INC2	I	Current detection amplifier (Current Amp2) input terminal
13	+ INE2	I	Error amplifier (Error Amp2) non-inverted input terminal
14	– INE2	I	Error amplifier (Error Amp2) inverted input terminal
15	FB23	O	Error amplifier (Error Amp2, 3) output terminal
16	– INE3	I	Error amplifier (Error Amp3) inverted input terminal
17	OUTD	O	With IC in standby mode, this terminal is set to Hi-Z to prevent loss of current through output voltage setting resistance. Set CTL terminal to "H" level to output "L" level.
18	CS	—	Soft-start capacitor connection terminal
19	RT	—	Triangular waveform oscillation frequency setting resistor connection terminal
20	VREF	O	Reference voltage output terminal
21	GND	—	Ground terminal
22	CTL-1	I	DC/DC converter block power supply control terminal
23	CTL-2	I	Current detection amplifier (Current Amp1) power supply control terminal
24	OUT-CP	O	External main-side FET charge pump output terminal for driving gate
25	PGND	—	Ground terminal
26	OUT-2	O	External synchronous rectification-side FET output terminal for driving gate
27	VS	—	External main-side FET source connection terminal
28	OUT-1	O	External main-side FET output terminal for driving gate
29	CB	—	This terminal generates a voltage of "VCC + about 5 V" with a capacitor and an SBD connected to the OUT-CP, VB, and CB terminals.
30	VB	O	Output circuit bias output terminal

CB terminal capacitor	C _{CB}	—	0.47	1.0	—	μF
Bias output capacitor	C _{VB}	—	0.47	1.0	—	μF
Reference voltage output capacitor	C _{REF}	—	—	0.1	1.0	μF
Operating ambient temperature	T _A	—	-30	+25	+85	°C

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

■ FUNCTIONAL DESCRIPTION

1. DC/DC Converter Functions

(1) Reference voltage block (REF)

The reference voltage circuit generates a temperature-compensated reference voltage (5.0 V Typ) using the voltage supplied from the VCC terminal (pin 1). The voltage is used as the reference voltage for the IC's internal circuit.

The reference voltage can be used to supply a load current of up to 1 mA to an external device through the VREF terminal (pin 20).

(2) Triangular wave oscillator block (OSC)

The triangular wave oscillator incorporates a triangular oscillation frequency setting capacitor connected respectively to the RT terminal (pin 19) to generate triangular oscillation waveforms.

The triangular oscillation waveforms are input to the IC's internal PWM comparator.

(3) Error amplifier block (Error Amp1)

The error amplifier detects output signal of current detection amplifier (Current Amp2) and outputs PWM control signal by comparison with +INE1 terminal (pin 7), also controls charge current.

Charge current controls by this amplifier and by the error amplifier (Error Amp2) allow two constant current values to be set to offer fail-safe control.

By connecting a feedback resistor and capacitor between FBI terminal (pin 9) and – INE1 terminal (pin 8), it is possible to create any desired level of loop gain, thereby providing stable phase compensation to the system.

Also, it is possible to prevent rush current at power supply start-up by connecting a soft-start capacitor with the CS terminal (pin 18).

The use of Error amplifier for soft-start detection makes it possible for a system to operate on a fixed soft-start time that is independent of the output load.

The amplifier can serve for constant current control in combination with the current detection amplifier (Current Amp1).

(4) Error amplifier block (Error Amp2)

The error amplifier detects output signal of current detection amplifier (Current Amp2) and outputs PWM control signal by comparison with +INE2 terminal (pin 13), also controls charge current.

By connecting a feedback resistor and capacitor between FB23 terminal (pin 15) and – INE2 terminal (pin 14), it is possible to create any desired level of loop gain, thereby providing stable phase compensation to the system.

Also, it is possible to prevent rush current at power supply start-up by connecting a soft-start capacitor with the CS terminal (pin 18).

The use of Error amplifier for soft-start detection makes it possible for a system to operate on a fixed soft-start time that is independent of the output load.

[查询"MB39A107"供应商](#)

(5) Error amplifier block (Error Amp3)

The error amplifier (Error Amp3) detects the DC/DC converter output voltage and outputs PWM control signals.

An arbitrary output voltage can be set for 1 to 4 cells by connecting external output voltage setting resistors to the error amplifier inverting input pins.

By connecting a feedback resistor and capacitor between FB23 terminal (pin 15) and – INE3 terminal (pin 16), it is possible to create any desired level of loop gain, thereby providing stable phase compensation to the system.

Also, it is possible to prevent rush current at power supply start-up by connecting a soft-start capacitor with the CS terminal (pin 18).

The use of Error amplifier for soft-start detection makes it possible for a system to operate on a fixed soft-start time that is independent of the output load.

(6) Current detection amplifier block (Current Amp1)

The current detection amplifier (Current Amp1) uses the +INC1 terminal (pin 5) and –INC1 terminal (pin 4) to detect a voltage drop which occurs between both ends of the sense resistor (R_{S2}) due to the flow of the AC adapter current and outputs the signal amplified 25 times to the OUTC1 terminal (pin 3) .

It is also possible to set an offset voltage equal to the voltage applied to the IOFA1 terminal (pin 6) .

(7) Current detection amplifier block (Current Amp2)

The current detection amplifier (Current Amp2) uses the +INC2 terminal (pin 12) and –INC2 terminal (pin 11) to detect a voltage drop which occurs between both ends of the output sense resistor (R_{S1}) due to the flow of the charge current and outputs the signal amplified 25 times to the OUTC2 terminal (pin 10) .

(8) PWM comparator block (PWM Comp.)

The PWM comparator is a voltage-pulse width modulator that controls the output duty depending on the output voltage of error amplifier (Error Amp1, Error Amp2 and Error Amp3).

The PWM comparator compares the triangular wave voltage generated by the triangular wave oscillator with the error amplifier output voltage. Then it turns on the output transistor on the main side and turns off the output transistor on the synchronous rectification side during the interval in which the triangular wave voltage is lower than the error amplifier output voltage.

(9) Output block (Drv-1, Drv-2)

The output circuit on the main side and on the synchronous rectification side are both in the totem pole configuration, capable of driving an external Nch MOS FET.

(10) Charge pump block (Drv-CP)

The CB terminal is a power supply terminal of output circuit (Drv-1) for the main side external Nch MOS FET drive. The CB terminal generates “VCC + about 5 V” in the OUT-CP terminal (pin 24) , VB terminal (pin 30) , and CB terminal (pin 29) by connecting the capacitor with SBD.

MB39A107

[查询"MB39A107"供应商](#)

(11) Power supply control block

Setting the CTL-1 terminal (pin 22) and CTL-2 terminal (pin 23) "L" level in the standby mode.

(The supply current is 10 µA at maximum in the standby mode.) Setting the CTL-1 and CTL-2 terminals "H" level allows the DC/DC converter and current detection amplifier (Current Amp1) to operate independently of each other.

CTL function table

CTL-1	CTL-2	DC/DC converter block	Current Amp1
L	L	OFF	OFF
H	L	ON	OFF
L	H	OFF	ON
H	H	ON	ON

(12) Bias voltage block

6 V (Typ) is as a power supply of the output circuit and potential for the charge pump output voltage setting.

(13) Battery voltage detection comparator block (- INEComp.)

At least 95% of the battery set voltage is detected to turn off the output transistor of the output block (Drv-2) on the synchronous rectification side.

2. Protection Functions

(1) Under voltage lockout protection circuit block (VREF-UVLO)

The momentary decrease in internal reference voltage (VREF) may cause malfunctions in the control IC, resulting in breakdown or degradation of the system.

To prevent such malfunctions, under voltage lockout protection circuit detects internal reference voltage drop and fixes OUT-1 terminal (pin 28) and OUT-2 terminal (pin 26) to "L" level.

The system restores voltage supply when the internal reference voltage reaches the threshold voltage of the under voltage lockout protection circuit.

Protection circuit (VREF-UVLO) operation function table

At UVLO operating (VRFE voltage is lower than UVLO threshold voltage.)
The logic of following terminal is fixed.

OUTD	OUT-1	OUT-2	OUT-CP	CS	VB
Hi-Z	L	L	L	L	L

(2) Under voltage lockout protection circuit (VB-UVLO)

The transient state or a momentary decrease in supply voltage, which occurs when the bias voltage (VB) for output circuit is turned on, may cause malfunction in the control IC, resulting in breakdown or degradation of the system.

To prevent such malfunctions, under voltage lockout protection circuit detects a bias voltage drop, and fixes OUT-1 terminal (pin 28) and OUT-2 terminal (pin 26) to "L" level.

The system restores voltage supply when the power supply voltage or the internal reference voltage reaches the threshold voltage of the under voltage lockout protection circuit.

Protection circuit (VB-UVLO)operation function table

At UVLO operating (VB voltage is lower than UVLO threshold voltage.)
The logic of following terminals is fixed.

OUT-1	OUT-2	OUT-CP	CS
L	L	L	L

(3) Under input voltage detection comparator block (UVComp.)

Decrease of input voltage is detected and OUT-1 terminal (pin 28) and OUT-2 terminal (pin 26) are fixed to "L" level.
In addition, an arbitrary detection voltage value can be set with an external resistor.

The system restores voltage supply when the input voltage reaches or exceeds the threshold voltage of the under input voltage detection comparator.

Protection circuit (UVComp.)operation function table

At under input voltage detection (Input voltage is lower than UVComp. threshold voltage.)
The logic of following terminals is fixed.

OUT-1	OUT-2	OUT-CP	CS
L	L	L	L

3. Soft-start function

Soft-start block (SOFT)

Connecting a capacitor to the CS terminal (pin 18) prevents rush currents from flowing upon activation of the power supply.

Using the error amplifier to detect a soft-start allows to soft-start at constant setting time intervals independent of the output load of the DC/DC converter.

MB39A107

[查询"MB39A107"供应商](#)

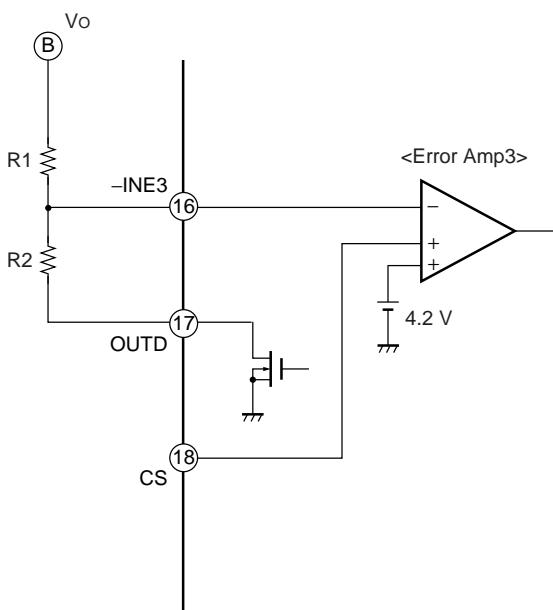

■ SETTING THE CHARGING VOLTAGE

The charging voltage (DC/DC output voltage) can be set by connecting an external output voltage setting resistors (R1, R2) to the -INE3 terminal (pin 16) .

Select a resistance value at which the ON resistance (35 Ω at 1 mA) of the built-in FET connected to the OUTD terminal (pin 17) can be ignored.

Battery charging voltage : V_o

$$V_o \text{ (V)} = \frac{R1 + R2}{R2} \times -\text{INE3} \text{ (V)}$$

■ SETTING THE CHARGING CURRENT

The charge current value (output limit current) can be set depending on the voltage value at the +INE2 terminal (pin 13) .

If a current exceeding the setting value attempts to flow, the charging voltage drops according to the setting current value.

Battery charge current setting voltage : + INE2

$$+ \text{INE2} \text{ (V)} = 25 \times I_{\text{chg}} \text{ (A)} \times R_s \text{ (\Omega)}$$

■ SETTING THE TRIANGULAR WAVE OSCILLATION FREQUENCY

The triangular wave oscillation frequency can be set by the timing resistor (R_T) connected to the RT terminal (pin 19) .

Triangular oscillation frequency : f_{osc}

$$f_{\text{osc}} \text{ (kHz)} \doteq \frac{23500}{R_T \text{ (k}\Omega\text{)}}$$

[查询"MB39A107"供应商](#)

■ SETTING THE SOFT-START TIME

(1) Setting constant voltage mode soft-start

For preventing rush current upon activation of IC, the IC allows soft-start using the capacitor (C_s) connected to the CS terminal (pin 18).

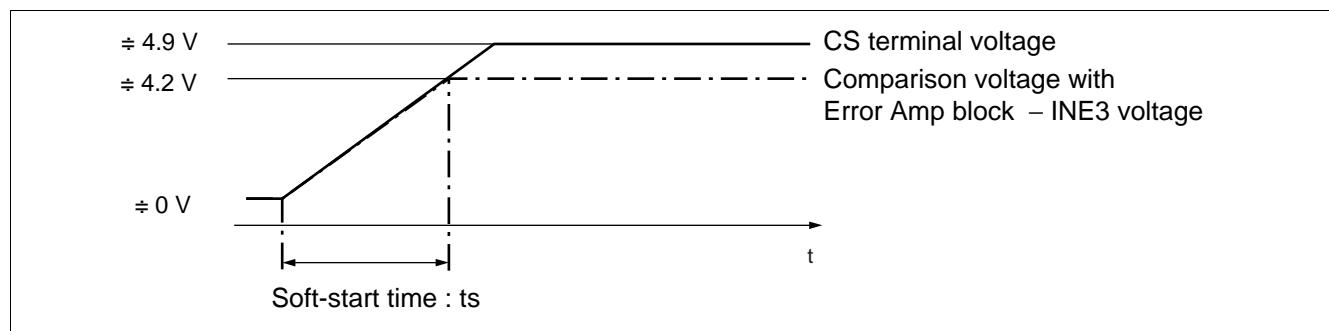

When the CTL-1 terminal (pin 22) is placed under "H" level and IC is activated (threshold voltage of VCC \geq UVLO), and Q2 is turned off and the external soft-start capacitor (C_s) connected to the CS terminal is charged at 10 μ A.

The Error Amp3 output (FB23 terminal (pin 15)) is determined by comparison between the lower voltage of the two non-inverted input terminal voltages (4.2 V and - CS terminal voltage), and the inverted input terminal voltage (at the -INE3 terminal (pin 16)). FB23 during soft-start intervals (CS terminal voltage < 4.2 V) is therefore determined through comparison between the -INE3 terminal voltage and CS terminal voltage and the DC/DC converter output voltage is proportional to the CS terminal voltage rising as the external soft-start capacitor connected to the CS terminal is charged.

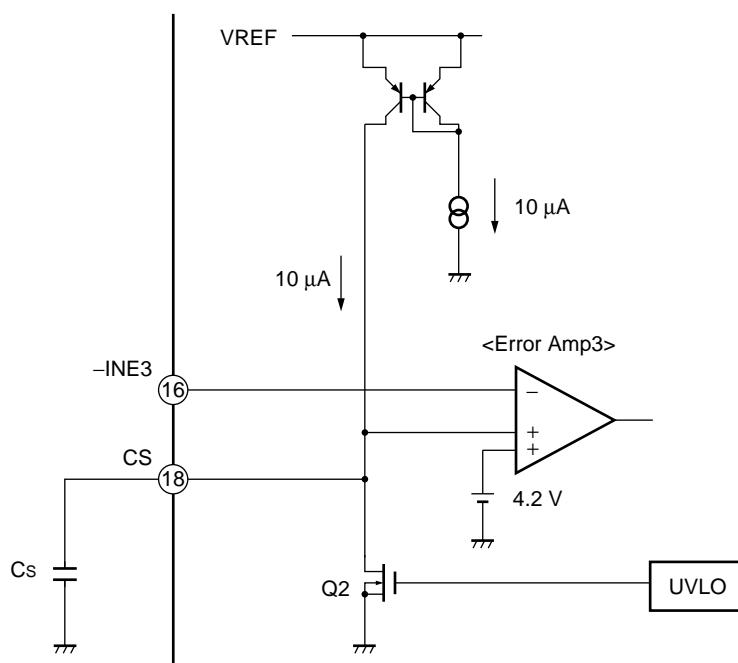

The soft-start time is obtained by the following formula.

Soft start time : t_s (time to output voltage 100%)

$$t_s \text{ (s)} \doteq 0.42 \times C_s \text{ (\mu F)}$$

• Soft-start circuit

MB39A107

[查询"MB39A107"供应商](#)

(2) Setting constant current mode soft-start

For preventing rush current upon activation of IC, the IC allows soft-start using the capacitor (C_S) connected to the CS terminal (pin 18) .

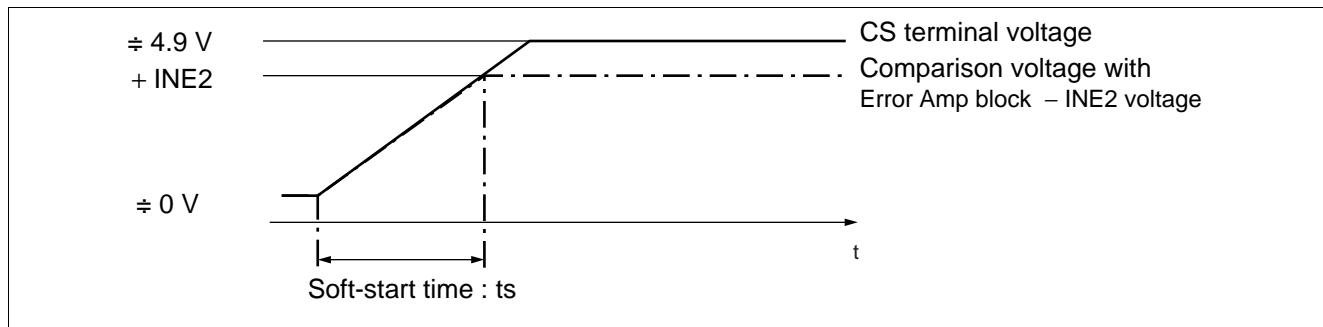

When the CTL-1 terminal (pin 22) is placed under "H" level and IC is activated (threshold voltage of VCC \geq UVLO) , and Q2 is turned off and the external soft-start capacitor (C_S) connected to the CS terminal is charged at 10 μ A.

The error Amp2 output (FB23 terminal (pin 15)) is determined by comparison between the lower voltage of the two non-inverted input terminal voltages (at the +INE2 terminal (pin 13) and CS terminal) , and the inverted input terminal voltage (at the -INE2 terminal (pin 14)) . FB23 during soft-start intervals (CS terminal voltage $<$ +INE2) is therefore determined through comparison between the -INE2 terminal voltage and CS terminal voltage and the DC/DC converter output current is proportional to the CS terminal voltage rising as the external soft-start capacitor connected to the CS terminal is charged.

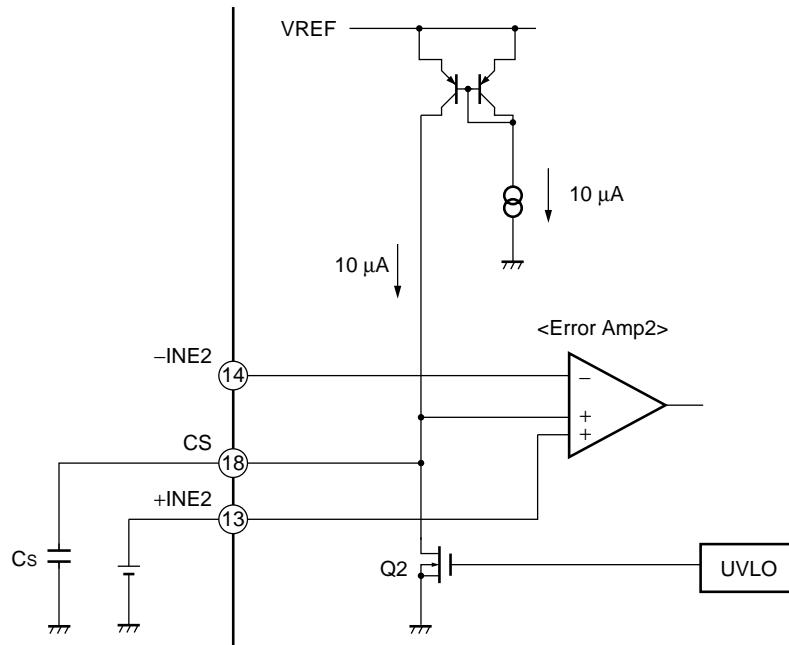

The soft-start time is obtained by the following formula.

Soft start time : t_s (time to output voltage 100%)

$$t_s \text{ (s)} = \frac{+ \text{INE2}}{10 \mu\text{A}} \times C_S \text{ (\mu F)}$$

• Soft-start circuit

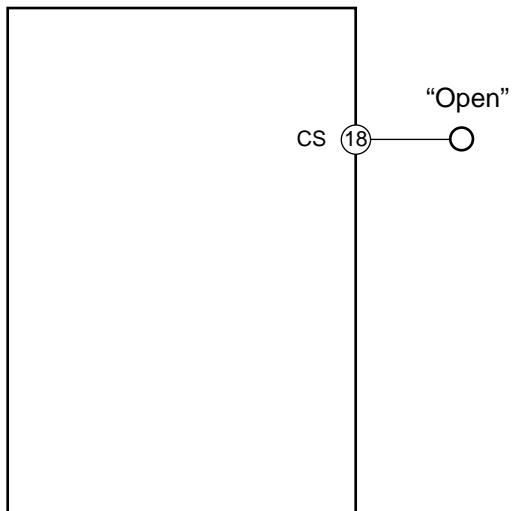

[查询"MB39A107"供应商](#)

■ PROCESSING WITHOUT USING OF THE SOFT-START FUNCTION

When soft-start function is not used, leave the CS terminal (pin 18) open.

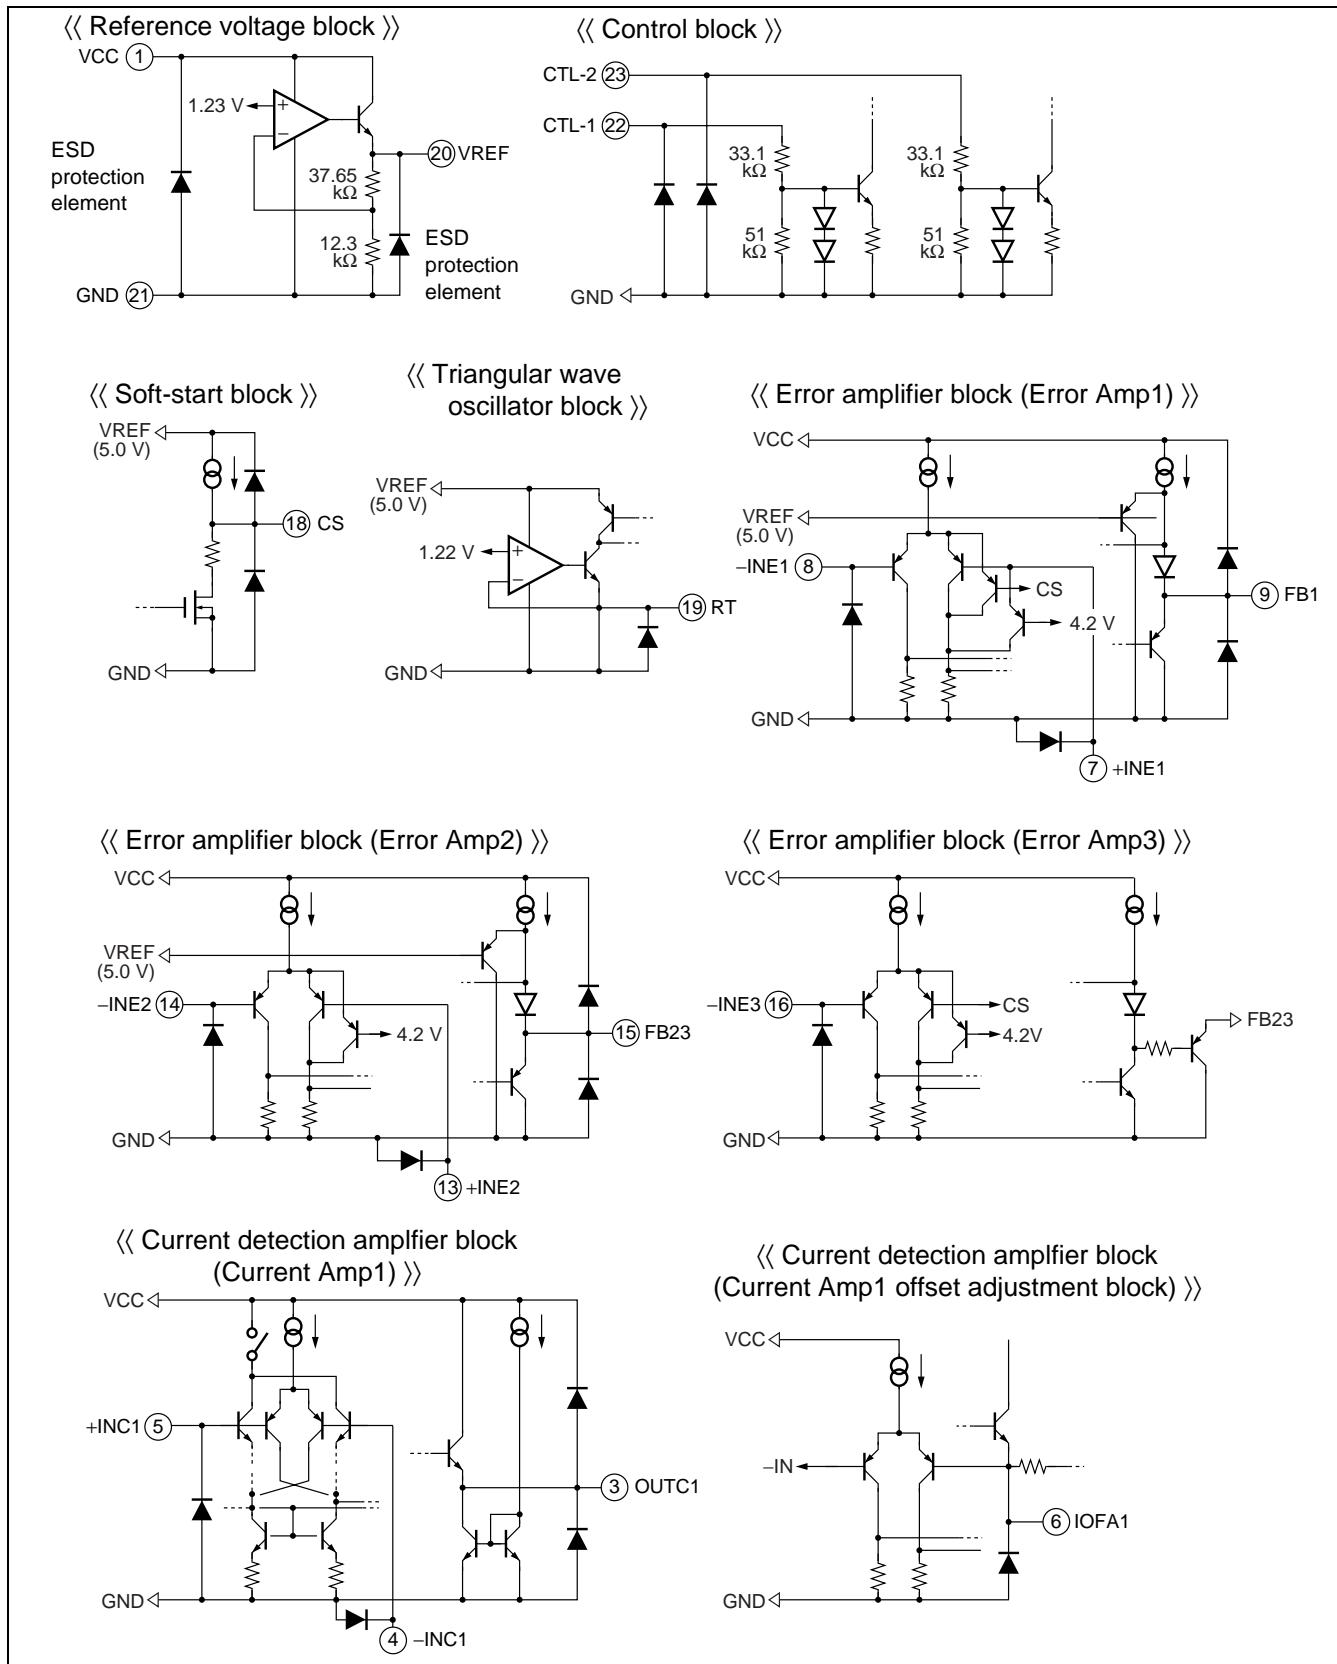

- When no soft-start function is specified

■ SELECTION OF COMPONENTS

- Nch MOS FET

The Nch MOS FET for switching use should be rated for at least + 20% more than the maximum input voltage. To minimize continuity loss, use a FET with low $R_{DS(ON)}$ between the drain and source. For high input voltage and high frequency operation, on/off-cycle switching loss will be higher so that power dissipation must be considered. In this application, the μPA2752 (NEC products) is used. Continuity loss, on/off switching loss and total loss are determined by the following formulas. The selection must ensure that peak drain current does not exceed rated values.

Continuity loss : P_C

$$P_C = I_D^2 \times R_{DS(ON)} \times \text{Duty}$$

On-cycle switching loss : $P_{S(ON)}$

$$P_{S(ON)} = \frac{V_{D(\text{Max})} \times I_D \times t_f \times f_{osc}}{6}$$

Off-cycle switching loss : $P_{S(OFF)}$

$$P_{S(OFF)} = \frac{V_{D(\text{Max})} \times I_{D(\text{Max})} \times t_f \times f_{osc}}{6}$$

Total loss : P_T

$$P_T = P_C + P_{S(ON)} + P_{S(OFF)}$$

Example) Using the μPA2752

Setting 16.8V

Main side

Input voltage $V_{IN(\text{Max})} = 25$ V, output voltage $V_o = 16.8$ V, drain current $I_D = 4.5$ A, oscillation frequency $f_{osc} = 500$ kHz, $L = 5.2 \mu\text{H}$, drain-source on resistance $R_{DS(ON)} = 20 \text{ m}\Omega$, $t_r = 6.2$ ns, $t_f = 5.8$ ns

Drain current (Max) : $I_{D(\text{Max})}$

$$\begin{aligned} I_{D(\text{Max})} &= I_0 + \frac{V_{IN(\text{Max})} - V_o}{2L} t_{on} \\ &= 4.5 + \frac{25 - 16.8}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.672 \\ &\doteq \underline{5.56 \text{ A}} \end{aligned}$$

Drain current (Min) : $I_{D(\text{Min})}$

$$\begin{aligned} I_{D(\text{Min})} &= I_0 - \frac{V_{IN(\text{Max})} - V_o}{2L} t_{on} \\ &= 4.5 - \frac{25 - 16.8}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.672 \\ &\doteq \underline{3.44 \text{ A}} \end{aligned}$$

[查询"MB39A107"供应商](#)

$$\begin{aligned} P_C &= I_D^2 \times R_{DS(ON)} \times \text{Duty} \\ &= 4.5^2 \times 0.02 \times 0.672 \\ &\doteq 0.272 \text{ W} \end{aligned}$$

$$\begin{aligned} P_{S(ON)} &= \frac{V_{D(\text{Max})} \times I_D \times t_r \times f_{osc}}{6} \\ &= \frac{25 \times 4.5 \times 6.2 \times 10^{-9} \times 500 \times 10^3}{6} \\ &\doteq 0.058 \text{ W} \end{aligned}$$

$$\begin{aligned} P_{S(OFF)} &= \frac{V_{D(\text{Max})} \times I_{D(\text{Max})} \times t_f \times f_{osc}}{6} \\ &= \frac{25 \times 5.56 \times 5.8 \times 10^{-9} \times 500 \times 10^3}{6} \\ &\doteq 0.067 \text{ W} \end{aligned}$$

$$\begin{aligned} P_T &= P_C + P_{S(ON)} + P_{S(OFF)} \\ &\doteq 0.272 + 0.058 + 0.067 \\ &\doteq 0.397 \text{ W} \end{aligned}$$

The above power dissipation figures for the μPA2752 are satisfied with ample margin at 2 W (Ta = + 25 °C).

Synchronous rectification side

Input voltage $V_{IN(\text{Max})} = 25$ V, output voltage $V_o = 16.8$ V, drain current $I_D = 4.5$ A, oscillation frequency $f_{osc} = 500$ kHz, $L = 5.2 \mu\text{H}$, drain-source on resistance $R_{DS(ON)} \doteq 20 \text{ m}\Omega$, $t_r = 6.2 \text{ ns}$, $t_f = 5.8 \text{ ns}$

Drain current (Max) : $I_{D(\text{Max})}$

$$\begin{aligned} I_{D(\text{Max})} &= I_o + \frac{V_o}{2L} t_{off} \\ &= 4.5 + \frac{16.8}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times (1 - 0.672) \\ &\doteq 5.56 \text{ A} \end{aligned}$$

Drain current (Min) : $I_{D(\text{Min})}$

$$\begin{aligned} I_{D(\text{Min})} &= I_o - \frac{V_o}{2L} t_{off} \\ &= 4.5 - \frac{16.8}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times (1 - 0.672) \\ &\doteq 3.44 \text{ A} \end{aligned}$$

MB39A107

[查询"MB39A107"供应商](#)

$$\begin{aligned}P_C &= I_D^2 \times R_{DS(ON)} \times \text{Duty}_{(OFF)} \\&= 4.5^2 \times 0.02 \times (1 - 0.672) \\&\doteq 0.133 \text{ W}\end{aligned}$$

$$\begin{aligned}P_{S(ON)} &= \frac{V_F \times I_D \times t_r \times f_{osc}}{6} \\&= \frac{0.45 \times 4.5 \times 6.2 \times 10^{-9} \times 500 \times 10^3}{6} \\&\doteq 0.001 \text{ W}\end{aligned}$$

$$\begin{aligned}P_{S(OFF)} &= \frac{V_F \times I_{D(\text{Max})} \times t_f \times f_{osc}}{6} \\&= \frac{0.45 \times 5.56 \times 5.8 \times 10^{-9} \times 500 \times 10^3}{6} \\&\doteq 0.001 \text{ W}\end{aligned}$$

$$\begin{aligned}P_T &= P_C + P_{S(ON)} + P_{S(OFF)} \\&\doteq 0.133 + 0.001 + 0.001 \\&\doteq 0.135 \text{ W}\end{aligned}$$

The above power dissipation figures for the μPA2752 are satisfied with ample margin at 2 W (Ta = + 25 °C).

Setting 12.6V

Main side

Input voltage $V_{IN(\text{Max})} = 20$ V, output voltage $V_o = 12.6$ V, drain current $I_D = 4.5$ A, oscillation frequency $f_{osc} = 500$ kHz, $L = 5.2 \mu\text{H}$, drain-source on resistance $R_{DS(ON)} \doteq 20 \text{ m}\Omega$, $t_r = 6.2 \text{ ns}$, $t_f = 5.8 \text{ ns}$

Drain current (Max) : $I_{D(\text{Max})}$

$$\begin{aligned}I_{D(\text{Max})} &= I_o + \frac{V_{IN(\text{Max})} - V_o}{2L} \cdot t_{on} \\&= 4.5 + \frac{20 - 12.6}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.63 \\&\doteq 5.40 \text{ A}\end{aligned}$$

Drain current (Min) : $I_{D(\text{Min})}$

$$\begin{aligned}I_{D(\text{Min})} &= I_o - \frac{V_{IN(\text{Max})} - V_o}{2L} \cdot t_{on} \\&= 4.5 - \frac{20 - 12.6}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.63 \\&\doteq 3.60 \text{ A}\end{aligned}$$

$$\begin{aligned}P_C &= I_D^2 \times R_{DS(ON)} \times \text{Duty}_{(OFF)} \\&= 4.5^2 \times 0.02 \times (1 - 0.63) \\&\doteq \underline{0.150 \text{ W}}\end{aligned}$$

$$\begin{aligned}P_{S(ON)} &= \frac{V_F \times I_D \times t_r \times f_{osc}}{6} \\&= \frac{0.45 \times 4.5 \times 6.2 \times 10^{-9} \times 500 \times 10^3}{6} \\&\doteq \underline{0.001 \text{ W}}\end{aligned}$$

$$\begin{aligned}P_{S(OFF)} &= \frac{V_F \times I_{D(\text{Max})} \times t_f \times f_{osc}}{6} \\&= \frac{0.45 \times 5.40 \times 5.8 \times 10^{-9} \times 500 \times 10^3}{6} \\&\doteq \underline{0.001 \text{ W}}\end{aligned}$$

$$\begin{aligned}P_T &= P_C + P_{S(ON)} + P_{S(OFF)} \\&\doteq 0.15 + 0.001 + 0.001 \\&\doteq \underline{0.152 \text{ W}}\end{aligned}$$

The above power dissipation figures for the μPA2752 are satisfied with ample margin at 2 W (Ta = + 25 °C).

- Inductor

In selecting inductors, it is of course essential not to apply more current than the rated capacity of the inductor, but also to note that the lower limit for ripple current is a critical point that if reached will cause discontinuous operation and a considerable drop in efficiency. This can be prevented by choosing a higher inductance value, which will enable continuous operation under light loads. Note that if the inductance value is too high, however, direct current resistance (DCR) is increased and this will also reduce efficiency. The inductance must be set at the point where efficiency is greatest.

Note also that the DC superimposition characteristic become worse as the load current value approaches the rated current value of the inductor, so that the inductance value is reduced and ripple current increases, causing loss of efficiency.

The selection of rated current value and inductance value will vary depending on where the point of peak efficiency lies with respect to load current.

Inductance values are determined by the following formulas.

The L value for all load current conditions is set so that the peak to peak value of the ripple current is 1/2 the load current or less.

Inductance value : L

$$L \geq \frac{2(V_{IN} - V_o)}{I_o} \text{ ton}$$

查询"MB39A107"供应商

16.8 V output

Example :

$$\begin{aligned} L &\geq \frac{2(V_{IN(\text{Max})} - V_o)}{I_o} \text{ ton} \\ &\geq \frac{2 \times (25 - 16.8)}{4.5} \times \frac{1}{500 \times 10^3} \times 0.672 \\ &\geq \underline{4.9 \mu\text{H}} \end{aligned}$$

12.6 V output

Example :

$$\begin{aligned} L &\geq \frac{2(V_{IN(\text{Max})} - V_o)}{I_o} \text{ ton} \\ &\geq \frac{2 \times (20 - 12.6)}{4.5} \times \frac{1}{500 \times 10^3} \times 0.63 \\ &\geq \underline{4.1 \mu\text{H}} \end{aligned}$$

Inductance values derived from the above formulas are values that provide sufficient margin for continuous operation at maximum load current, but at which continuous operation is not possible at light loads. It is therefore necessary to determine the load level at which continuous operation becomes possible. In this application, the SUMIDA CDRH104R-5R2 is used. The following formula is available to obtain the load current as a continuous current condition when 5.2 μH is used.

Load current value under continuous operating conditions : I_o

$$I_o \geq \frac{V_o}{2L} \text{ toff}$$

Example : Using the CDRH104R-5R2

5.2 μH (tolerance $\pm 20\%$), rated current = 5.5 A

16.8 V output

$$\begin{aligned} I_o &\geq \frac{V_o}{2L} \text{ toff} \\ &\geq \frac{16.8}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times (1 - 0.672) \\ &\geq \underline{1.06 \text{ A}} \end{aligned}$$

MB39A107

12.6 V output

$$\begin{aligned} I_o &\geq \frac{V_o}{2L} t_{off} \\ &\geq \frac{12.6}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times (1 - 0.63) \\ &\geq \underline{0.897A} \end{aligned}$$

To determine whether the current through the inductor is within rated values, it is necessary to determine the peak value of the ripple current as well as the peak-to-peak values of the ripple current that affect the output ripple voltage.

The peak value and peak-to-peak value of the ripple current can be determined by the following formulas.

Peak Value : I_L

$$I_L \geq I_o + \frac{V_{IN} - V_o}{2L} t_{on}$$

Peak-Peak Value : ΔI_L

$$\Delta I_L = \frac{V_{IN} - V_o}{L} t_{on}$$

Example : Using the CDRH104R-5R2

5.2 μ H (tolerance $\pm 20\%$), rated current = 5.5 A

Peak Value

16.8 V output

$$\begin{aligned} I_L &\geq I_o + \frac{V_{IN(\text{Max})} - V_o}{2L} t_{on} \\ &\geq 4.5 + \frac{25 - 16.8}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.672 \\ &\geq \underline{5.56A} \end{aligned}$$

12.6 V output

$$\begin{aligned} I_L &\geq I_o + \frac{V_{IN(\text{Max})} - V_o}{2L} t_{on} \\ &\geq 4.5 + \frac{20 - 12.6}{2 \times 5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.63 \\ &\geq \underline{5.40A} \end{aligned}$$

[查询"MB39A107"供应商](#)

Peak-Peak Value

16.8 V output

$$\Delta I_L = \frac{V_{IN(\text{Max})} - V_o}{L} \text{ ton}$$

$$= \frac{25 - 16.8}{5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.672$$

$$\doteq \underline{2.12 \text{ A}}$$

12.6 V output

$$\Delta I_L = \frac{V_{IN(\text{Max})} - V_o}{L} \text{ ton}$$

$$= \frac{20 - 12.6}{5.2 \times 10^{-6}} \times \frac{1}{500 \times 10^3} \times 0.63$$

$$\doteq \underline{1.79 \text{ A}}$$

- Diode for charge pump

Using a low-leak diode increases efficiency a little; but using a signal diode is satisfactory. It is recommended to use a low-VF one. Also, use a capacitor for the charge pump, which is sufficiently larger value than the gate capacitor for the main-side FET. It is recommended to use a component between 0.1 μF to 1.0 μF .

■ NOTES ON USE

- Take account of common impedance when designing the earth line on a printed wiring board.
- Take measures against static electricity.
 - For semiconductors, use antistatic or conductive containers.
 - When storing or carrying a printed circuit board after chip mounting, put it in a conductive bag or container.
 - The work table, tools, and measuring instruments must be grounded.
 - The worker must put on a grounding device containing 250 k Ω to 1 M Ω resistors in series.
- Do not apply a negative voltage.
 - Applying a negative voltage of -0.3 V or less to an LSI may generate a parasitic transistor, resulting in malfunction.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of Fujitsu semiconductor device; Fujitsu does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information. Fujitsu assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of Fujitsu or any third party or does Fujitsu warrant non-infringement of any third-party's intellectual property right or other right by using such information. Fujitsu assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
