

## LMH0346

# 3 Gbps HD/SD SDI Reclocker with Dual Differential Outputs

## General Description

The LMH0346 3 Gbps HD/SD SDI Reclocker retimes serial digital video data conforming to the SMPTE 424M, SMPTE 292M, and SMPTE 259M (C) standards. The LMH0346 operates at serial data rates of 270 Mbps, 1.483 Gbps, 1.485 Gbps, 2.967 Gbps, and 2.97 Gbps. The LMH0346 supports DVB-ASI operation at 270 Mbps.

The LMH0346 automatically detects the incoming data rate and adjusts itself to retime the incoming data to suppress accumulated jitter. The LMH0346 recovers the serial data-rate clock and optionally provides it as an output. The LMH0346 has two differential serial data outputs; the second output may be selected as a low-jitter, data-rate clock output. Controls and indicators are: serial clock or second serial data output select, manual rate select input, SD/HD rate indicator output, lock detect output, auto/manual data bypass and output mute. The serial data inputs, outputs, and serial clock outputs are differential LVPECL compatible. The CML serial data and serial clock outputs are suitable for driving 100 $\Omega$  differentially terminated networks. The control logic inputs and outputs are LVCMOS compatible.

The LMH0346 is powered from a single 3.3V supply. Power dissipation is typically 370 mW. The device is housed in a 20-pin e-TSSOP package.

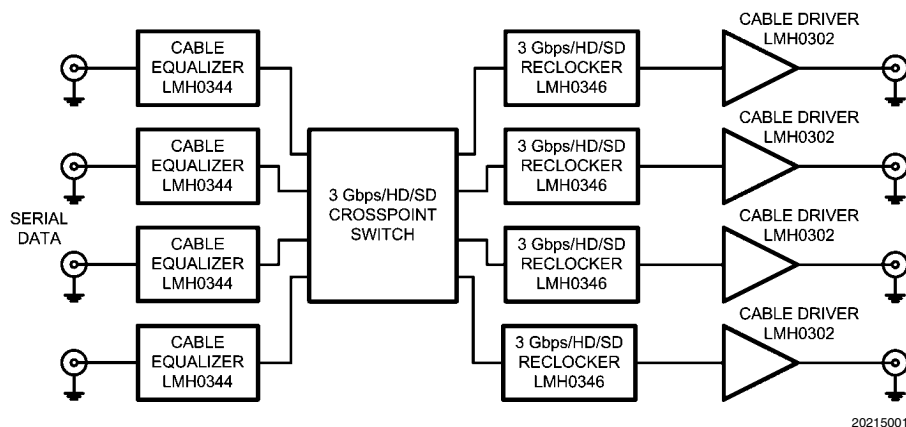

## Features

- Supports SMPTE 424M, SMPTE 292M, and SMPTE 259M (C) serial digital video standards
- Supports 270 Mbps, 1.483 Gbps, 1.485 Gbps, 2.967 Gbps, and 2.97 Gbps serial data rate operation
- Supports DVB-ASI at 270 Mbps
- Single 3.3V supply operation
- 370 mW typical power consumption
- Two differential, reclocked outputs
- Choice of second reclocked output or low-jitter, differential, data-rate clock output
- Single 27 MHz external crystal or reference clock input
- Manual rate select input
- SD/HD operating rate indicator output
- Lock Detect indicator output
- Output mute function for data and clock
- Auto/Manual reclocker bypass
- Differential LVPECL compatible serial data inputs and outputs
- LVCMOS control inputs and indicator outputs
- 20-Pin e-TSSOP package
- Industrial temperature range: -40°C to +85°C
- Footprint compatible with the LMH0046

## Applications

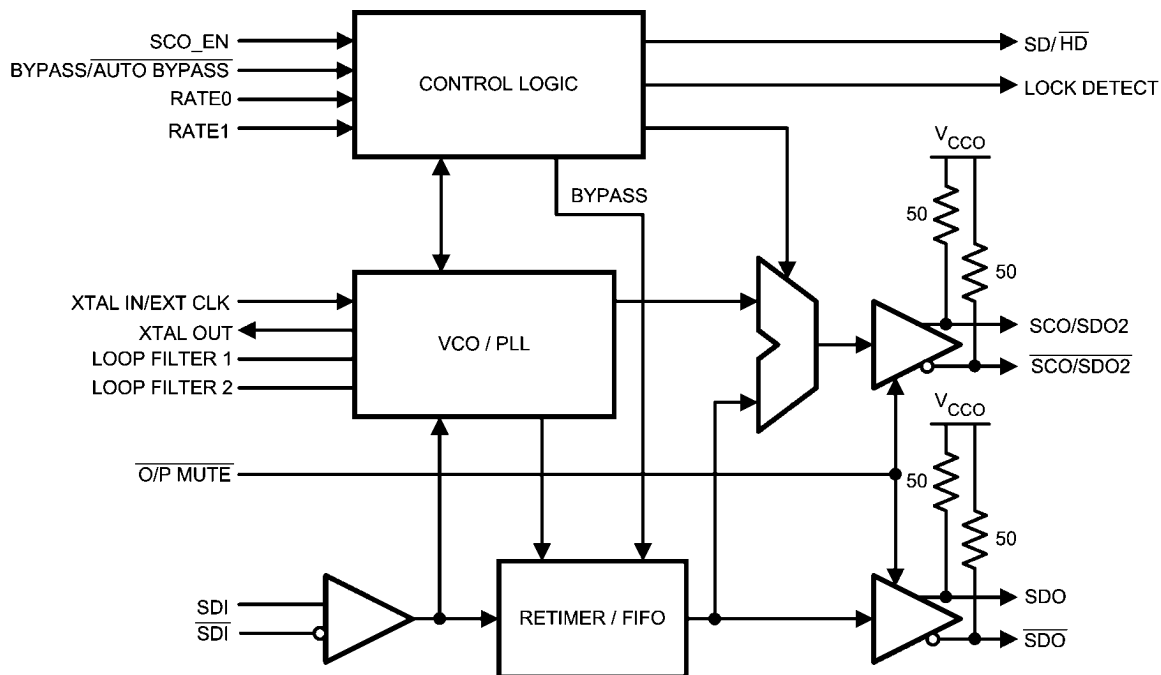

- SDTV/HDTV and 3 Gbps serial digital video interfaces for:
  - Digital video routers and switchers
  - Digital video processing and editing equipment
  - DVB-ASI equipment
  - Video standards and format converters

## Pin Descriptions

[查询"LMH0346\\_08"供应商](#)

Pin	Name	Description
1	LF1	Loop Filter
2	LF2	Loop Filter
3	RATE 0	Data Rate Select Input
4	RATE 1	Data Rate Select Input
5	SDI	Data Input True
6	$\overline{\text{SDI}}$	Data Input Complement
7	$V_{\text{CC}}$	Positive power supply input
8	BYPASS/AUTO BYPASS	Bypass/Auto Bypass mode select
9	OUTPUT MUTE	Data and Clock Output Mute Input (active low)
10	XTAL IN/EXT CLK	Crystal or External Oscillator Input
11	XTAL OUT	Crystal Oscillator Output
12	LOCK DETECT	PLL Lock Detect Output (active high)
13	SCO/SDO2	Serial Clock or Serial Data Output 2 Complement
14	SCO/SDO2	Serial Clock or Serial Data Output 2 True
15	$V_{\text{CCO}}$	Positive power supply input (Output Driver)
16	$\overline{\text{SDO}}$	Data Output Complement
17	SDO	Data Output True
18	$V_{\text{CCO}}$	Positive power supply input (Output Driver)
19	SD/HD	Data Rate Range Output
20	SCO_EN	Serial Clock or Serial Data 2 Output select (active high enables serial clock output)
DAP	$V_{\text{EE}}$	Connect exposed DAP to negative power supply (ground)

## Absolute Maximum Ratings (Note 1)

查询"LMH0346\_08"供应商

It is anticipated that this device will not be offered in a military qualified version. If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ( $V_{CC}-V_{EE}$ )	4.0V
Logic Supply Voltage ( $V_i$ )	$V_{EE}-0.15V$ to $V_{CC}+0.15V$
Logic Input Current (single input):	
$V_i = V_{EE}-0.15V$	-5 mA
$V_i = V_{CC}+0.15V$	+5 mA
Logic Output Voltage ( $V_o$ )	$V_{EE}-0.15V$ to $V_{CC}+0.15V$
Logic Output Source/Sink Current	$\pm 8$ mA
Serial Data Input Voltage ( $V_{SDI}$ )	$V_{CC}$ to $V_{CC}-2.0V$
Serial Data Output Sink Current ( $I_{SDO}$ )	24 mA

Package Thermal Resistance, e-TSSOP

$\theta_{JA}$	26.6°C/W
$\theta_{JC}$	2.4°C/W
Storage Temp. Range	-65°C to +150°C
Junction Temperature	+125°C
Lead Temperature (Soldering 4 Sec)	+260°C (Pb-free)
ESD Rating (HBM)	8 kV
ESD Rating (MM)	400V
ESD Rating (CDM)	2 kV

## Recommended Operating Conditions

Supply Voltage ( $V_{CC}-V_{EE}$ )	3.3V $\pm 5\%$
Logic Input Voltage	$V_{EE}$ to $V_{CC}$
Differential Serial Input Voltage	800 mV $\pm 10\%$
Serial Data or Clock Output Sink Current ( $I_{SO}$ )	16 mA max.
Operating Free Air Temperature ( $T_A$ )	-40°C to +85°C

## DC Electrical Characteristics

Over Supply Voltage and Operating Temperature ranges, unless otherwise specified. (Notes 2, 3)

**Note 1:** “Absolute Maximum Ratings” are those parameter values beyond which the life and operation of the device cannot be guaranteed. The stating herein of these maximums shall not be construed to imply that the device can or should be operated at or beyond these values. The table of “Electrical Characteristics” specifies acceptable device operating conditions.

**Note 2:** Current flow into device pins is defined as positive. Current flow out of device pins is defined as negative. All voltages are referenced to  $V_{EE}$  (equal to zero volts).

**Note 3:** Typical values are stated for:  $V_{CC} = +3.3V$ ,  $T_A = +25^\circ C$ .

**Note 4:** Spec is guaranteed by design.

**Note 5:**  $R_L = 100\Omega$  differential.

**Note 6:** Measured from first SDI transition until Lock Detect (LD) output goes high (true).

**Note 7:** Peak-to-peak amplitude with sinusoidal modulation per SMPTE RP 184-1996 paragraph 4.1. The test data signal shall be color bars.

**Note 8:** This parameter is guaranteed by characterization over voltage and temperature limits.

**Note 9:** Refer to “A1” in Figure 1 of SMPTE RP 184-1996.

**Note 10:** Refer to “A2” in Figure 1 of SMPTE RP 184-1996.

**Note 11:** PRBS  $2^{10}-1$ , input jitter = 31 ps<sub>p,p</sub>

**Note 12:** PRBS  $2^{10}-1$ , input jitter = 24 ps<sub>p,p</sub>

**Note 13:** PRBS  $2^{10}-1$ , input jitter = 22 ps<sub>p,p</sub>

## Device Description

The LMH0346 3 Gbps HD/SD SDI Reclocker is used in many types of digital video signal processing equipment. Supported serial digital video standards are SMPTE 259M (C), SMPTE 292M, and SMPTE 424M. Corresponding serial data rates are 270 Mbps, 1.483 Gbps, 1.485 Gbps, 2.967 Gbps, and 2.97 Gbps. DVB-ASI data at 270 Mbps may also be retimed. The LMH0346 retimes the serial data stream to suppress accumulated jitter. It provides two low-jitter, differential, serial data outputs. The second output may be selected to output either serial data or a low-jitter serial data-rate clock. Controls and indicators are: serial clock or second serial data output select, manual rate select input, SD/HD rate output, lock detect output, auto/manual data bypass and output mute.

Serial data inputs are CML and LVPECL compatible. Serial data and clock outputs are differential CML and produce LVPECL compatible levels. The output buffer design can drive AC or DC-coupled, terminated 100 $\Omega$  differential loads. The differential output level is 750 mV<sub>P-P</sub>  $\pm 10\%$  into 100 $\Omega$  AC or DC-coupled differential loads. Logic inputs and outputs are LVCMOS compatible.

The device package is a 20-pin e-TSSOP which has an exposed die attach pad. The exposed die attach pad is electrically connected to device ground ( $V_{EE}$ ) and is the negative electrical terminal for the device. This terminal must be connected to the negative power supply or circuit ground.

input is differential LVPECL compatible. The input is intended to be DC interfaced to devices such as the LMH0344 adaptive cable equalizer. The input is not internally terminated or biased. The input may be AC-coupled if a suitable input bias voltage is provided. *Figure 1* shows the equivalent input circuit for SDI and  $\overline{\text{SDI}}$ .

The LMH0346 has two, retimed, differential, serial data outputs, SDO and SCO/SDO2. These outputs provide low jitter, differential, retimed data to devices such as the LMH0302 cable driver. Output SCO/SDO2 is multiplexed and can provide either a second serial data output or a serial clock output. *Figure 2* shows the equivalent output circuit for SDO,  $\overline{\text{SDO}}$ , SCO/SDO2, and  $\overline{\text{SCO/SDO2}}$ .

The SCO\_EN input controls the operating mode for the SCO/SDO2 output. When the SCO\_EN input is high the SCO/SDO2 output provides a serial clock. When SCO\_EN is low, the SCO/SDO2 output provides retimed serial data.

Both differential serial data outputs, SDO and SCO/SDO2, are muted when the MUTE input is a logic low level. SCO/SDO2 also mutes when the Bypass mode is activated when this output is operating as the serial clock output. When muted, SDO and  $\overline{\text{SDO}}$  (or SDO2 and  $\overline{\text{SDO2}}$ ) will assume opposite differential output levels. The CML serial data outputs are differential LVPECL compatible. These outputs have internal 50 $\Omega$  pull-ups and are suitable for driving AC or DC-coupled, 100 $\Omega$  center-tapped, AC grounded or 100 $\Omega$  un-center-tapped, differentially terminated networks.

## Serial Data Inputs, Serial Data and Clock Outputs

### SERIAL DATA INPUT AND OUTPUTS

The differential serial data input, SDI, accepts serial digital video data at the rates specified in *Table 1*. The serial data

20215008

FIGURE 1. Equivalent SDI Input Circuit (SDI,  $\overline{\text{SDI}}$ )

20215009

**FIGURE 2. Equivalent SDO Output Circuit (SDO,  $\overline{\text{SDO}}$ , SCO/SDO2,  $\overline{\text{SCO/SDO2}}$ )**

### OPERATING SERIAL DATA RATES

This device operates at serial data rates of 270 Mbps, 1483 Mbps, 1485 Mbps, 2967 Mbps, and 2970 Mbps. The device does not lock to harmonics of these rates. The device does not lock and automatically enters the reclocker bypass mode for the following data rates: 143 Mbps, 177 Mbps, 360 Mbps, and 540 Mbps.

### SERIAL DATA CLOCK/SERIAL DATA 2 OUTPUT

The Serial Data Clock/Serial Data 2 Output is controlled by the SCO\_EN input and provides either a second retimed serial data output or a low jitter differential clock output appropriate to the serial data rate being processed. When operating as a serial clock output, the rising edge of the clock will be positioned within the corresponding serial data bit interval within 10% of the center of the data interval.

Differential output SCO/SDO2 functions as the second serial data output when the SCO\_EN input is a logic-low level. This output functions as the serial clock output when the SCO\_EN input is a logic-high level. The SCO\_EN input has an internal pull-down device and the default state of SCO\_EN is low (serial data output 2 enabled). SCO/SDO2 is muted when the MUTE input is a logic low level. When the Bypass mode is activated and this output is functioning as a serial clock output, the output will also be muted.

## Control Inputs and Indicator Outputs

### SERIAL DATA RATE SELECTOR

The Serial Data Rate Selector (RATE [1:0]) permits the user to fix the operating serial data rate. The pins have internal pull-downs which maintain a logic-low input condition unless externally driven to a logic-high condition. This input also serves to place the device in a test mode. The codes shown in Table 1 select the desired operating serial data rate. The LMH0346 then enters either the Auto-Rate Detect mode or a single operating rate. Selecting the 270 Mbps rate mode may also be used when reclocking DVB-ASI data. DVB-ASI data is MPEG2 coded data that is transmitted in 8B10B coding. The device will reclock this data without harmonic locking.

Auto-Rate Detect mode may be used for any supported data rate, including DVB-ASI.

**TABLE 1. Data Rate Select Input Codes**

Rate [1:0] Code	Data Rate or Mode	Comments
00	Auto-Rate Detect mode	
01	270 Mbps	May be used to support DVB-ASI operation
10	1483/1485 Mbps, 2967/2970 Mbps	

### LOCK DETECT

The Lock Detect (LD) output, when high, indicates that data is being received and the PLL is locked. LD may be connected to the MUTE input to mute the data and clock outputs when no data signal is being received. See Table 2.

### MUTE

The MUTE input, when low, mutes the serial data and clock outputs. It may be connected to Lock Detect or externally driven to mute or un-mute the outputs. If MUTE is connected to LD, then the data and clock outputs are muted when the PLL is not locked. This function overrides the Bypass function: see Table 2. MUTE has an internal pull-up device to enable the output by default.

### BYPASS/AUTO BYPASS

The Bypass/Auto Bypass input, when high, forces the device to output the data without reclocking it. When this input is low, the device automatically bypasses the reclocking function when the device is in an unlocked condition or the detected data rate is a rate which the device does not support. See Table 2. BYPASS/AUTO BYPASS has an internal pull-down device.

[查询"LMH0346 08"供应商](#)

TABLE 2. Control Functionality

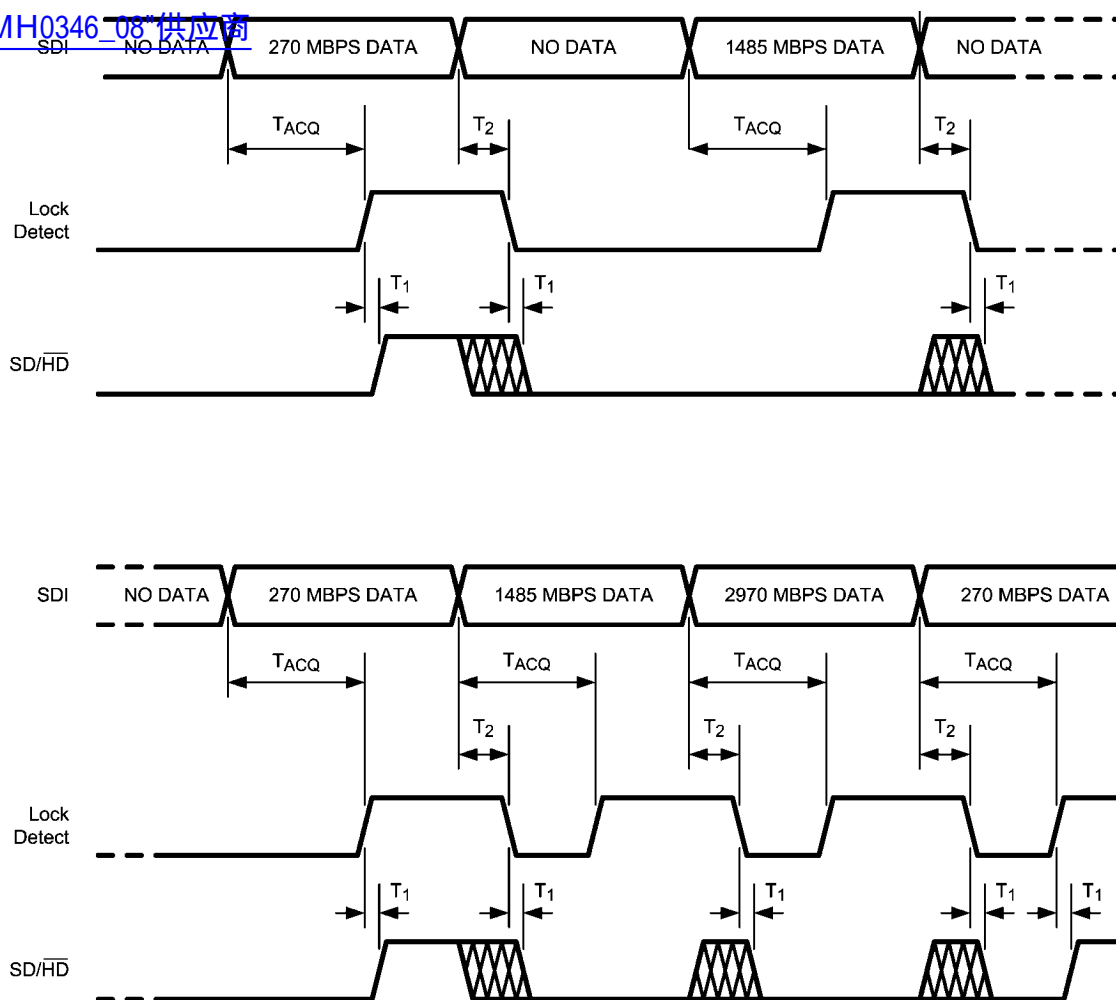

LOCK DETECT	OUTPUT MUTE	BYPASS/AUTO BYPASS	DEVICE STATUS
0	1	0	PLL unlocked, reclocker bypassed
1	1	0	PLL locked to supported data rate, reclocker not bypassed
X	0	X	Outputs muted
0	LOCK DETECT	X	Outputs muted
1	LOCK DETECT	0	PLL locked to supported data rate, reclocker not bypassed
1	LOCK DETECT	1	PLL locked to supported data rate, reclocker bypassed
X	1	1	Outputs not muted, reclocker bypassed

**SD/ $\overline{\text{HD}}$** 

The SD/ $\overline{\text{HD}}$  output indicates whether the LMH0346 is processing SD or HD / 3 Gbps data rates. It may be used to control another device such as the LMH0302 cable driver. When this output is high it indicates that the data rate is 270 Mbps. When low, the indicated data rate is 1483, 1485, 2967, or 2970 Mbps. The SD/ $\overline{\text{HD}}$  output is a registered function and

is only valid when the PLL is locked and the Lock Detect output is high. When the PLL is not locked (the Lock Detect output is low), the SD/ $\overline{\text{HD}}$  output defaults to HD (low). The SD/ $\overline{\text{HD}}$  output is undefined for a short time after lock detect assertion or deassertion due to a data rate change on SDI. See *Figure 3* for a timing diagram showing the relationship between SDI, Lock Detect, and SD/ $\overline{\text{HD}}$ .

查询"LMH0346\_08"供应商

$T_{ACQ}$  = Acquisition Time, defined in the AC Electrical Characteristics Table

$T_1$  = Time from Lock Detect assertion or deassertion until  $SD/\overline{HD}$  output is valid, typically 37 ns (one 27 MHz clock period)

$T_2$  = Time from SDI input change until Lock Detect deassertion, 1 ms maximum.  $SD/\overline{HD}$  output is not valid during this time.

20215005

**FIGURE 3. SDI, Lock Detect, and  $SD/\overline{HD}$  Timing**

#### SCO\_EN

Input SCO\_EN enables the SCO/SDO2 differential output to function either as a serial clock or second serial data output. SCO/SDO2 functions as a serial clock when SCO\_EN is high. This pin has an internal pull-down device. The default state (low) enables the SCO/SDO2 output as a second serial data output.

#### CRYSTAL OR EXTERNAL CLOCK REFERENCE

The LMH0346 uses a 27 MHz crystal or external clock signal as a timing reference input. A 27 MHz parallel resonant crystal and load network may be connected to the XTAL IN/EXT CLK and XTAL OUT pins. Alternatively, a 27 MHz LVCMOS compatible clock signal may be input to XTAL IN/EXT CLK. Parameters for a suitable crystal are given in Table 3.

TABLE 3. Crystal Parameters

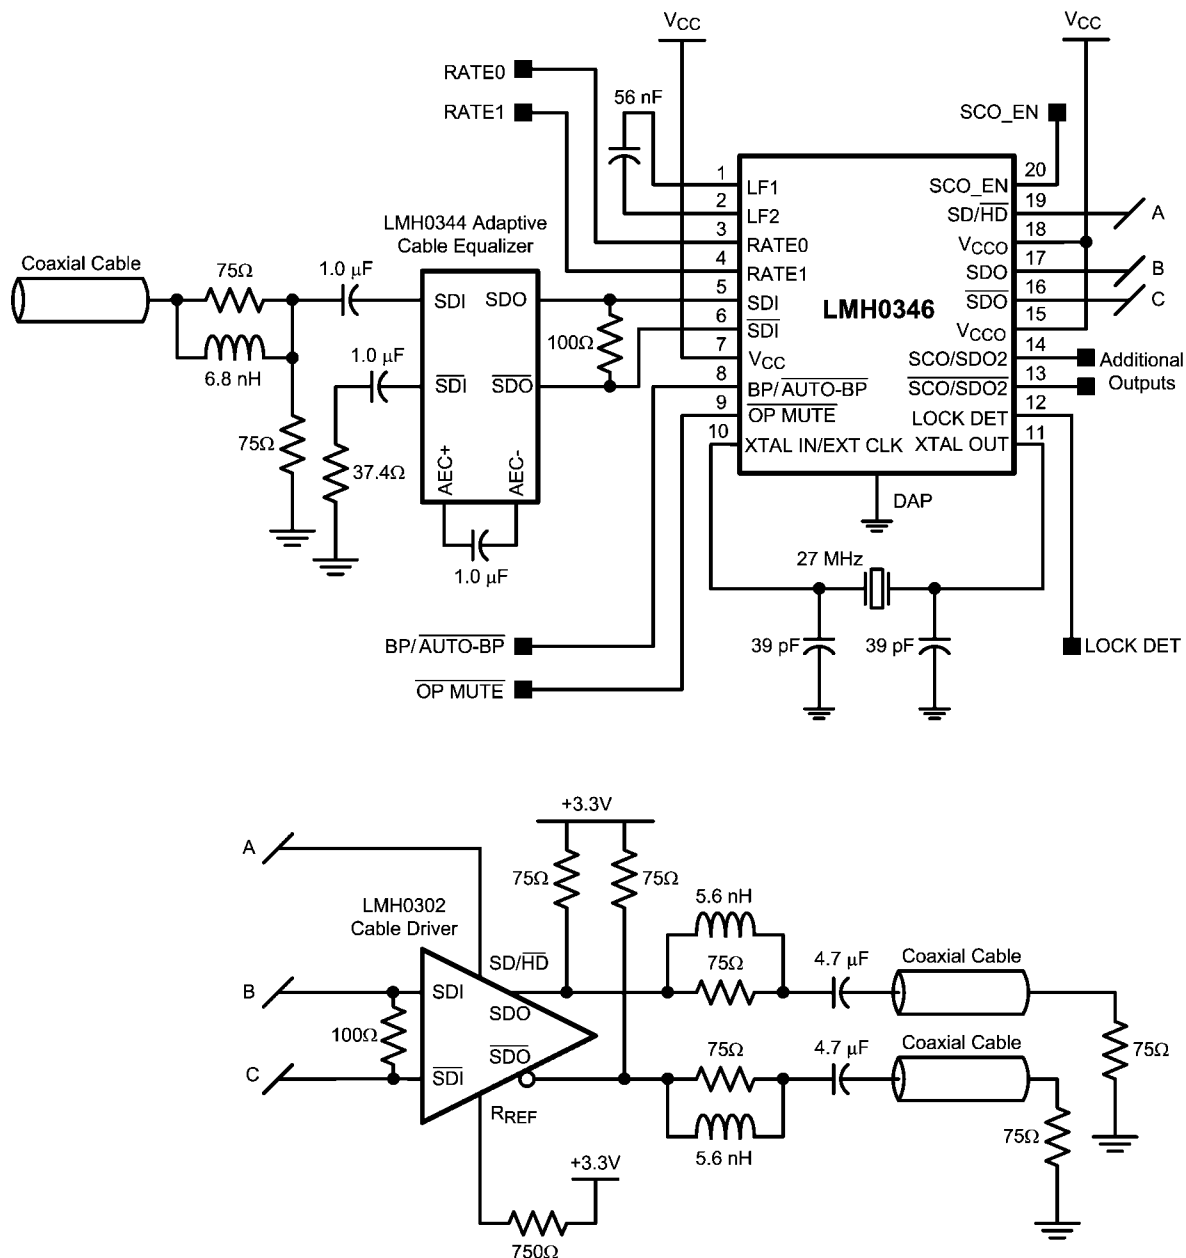

Parameter	Value
Frequency	27 MHz
Frequency Stability	±50 ppm @ recommended drive level
Operating Mode	Fundamental mode, Parallel Resonant
Load Capacitance	20 pF

Parameter	Value
Shunt Capacitance	7 pF
Series Resistance	40Ω max.
Recommended Drive Level	100 μW
Maximum Drive Level	500 μW
Operating Temperature Range	–10°C to +60°C
