

## **Operational Amplifiers**

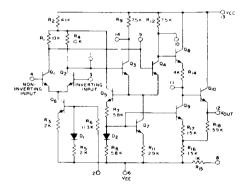

#### Features:

- These new types have all the desirable features and characteristics of their prototypes plus lower noise figures and improved input characteristics for offset voltage, offset current, bias current, and impedance
- All types are electrically identical within their voltage aroups
- For use in telemetry, data-processing, instrumentation, and communication equipment
- Built-in temperature stability from -55°C to +125°C for TO-5 style, and ceramic dual-in-line packages; 0°C to +70°C for plastic dual-in-line packages

#### Applications:

- Narrow-band and band-pass amplifier
- **Operational functions**
- Feedback amplifier
- DC and video amplifier
- Multivibrator
- . Oscillator
- Comparator
- Servo driver .
- Scaling adder
- Balanced modulator-driver

#### TYPICAL DYNAMIC CHARACTERISTICS AND TEST CIRCUITS

百间"CA301%Au供应商前ircles are for CA3029A, CA3030A trail: Numbers in Square Boxes are for CA3010A, CA3015A.

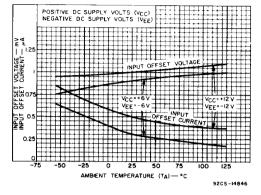

Fig. 2 — Input offset voltage and current

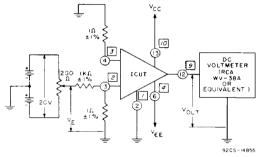

Fig. 4 — Input offset voltage, input offset voltage sensitivity, and and device dissipation test circuit.

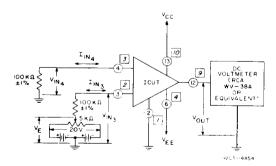

Fig. 5 — Input offset current and input bias current test circuit.

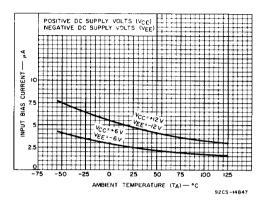

Fig. 3 — Input bias current

Procedure:

- Input Offset Voltage
- 1. Adjust VE for a DC Output Voltage (V<sub>OUT</sub>) of 0 ± 0.1 volts.
- 2. Measure VE and record input Offset Voltage in millivolts as  $V_{E}/1000.$
- Input Offset Voltage Sensitivity
- 1. Adjust V<sub>E</sub> for a DC Output Voltage (V<sub>OUT</sub>) of 0  $\pm$  0.1 volts.
- 2. Increase VCC by 1 volt and record output voltage (VOUT).
- 3. Decrease  $|V_{CC}|$  by 1 volt and record output voltage  $(V_{OUT})$ .
- 4. Divide the difference between V\_OUT measured in steps 2 and 3 by the change in V<sub>CC</sub> in steps 2 and 3.

$$\frac{v_{OUT}}{v_{CC}} = \frac{v_{OUT} (\text{Step 2}) - v_{OUT} (\text{Step 3})}{2 \text{ volts}}$$

5. Refer the reading to the input by dividing by Open Loop Voltage Gain (AOL)

- 6. Repeat procedures 1 through 5 for the Negative Supply (VFF).
- 7. Device Dissipation
- PT = VCCIC + VEEIE
- IC = Direct Current into Terminal 13 or 10
- $I_E = Direct Current out of Terminal 6 or 4$

#### Procedure:

Input Bias Current and Input Offset Current

- 1. Adjust VE for  $|V_{OUT}| \le 0.1 \text{ V DC}$ .
- 2. Measure and record V<sub>E</sub> and V<sub>IN4</sub>
- 3. Calculate the Input Bias Current using the following equation:

$$\mathbf{1}_{\mathbf{14}} = \frac{\mathbf{V}_{\mathbf{1N4}}}{\mathbf{100} \ \mathbf{k}\Omega}$$

4. Calculate the Input Offset Current using the following equation:

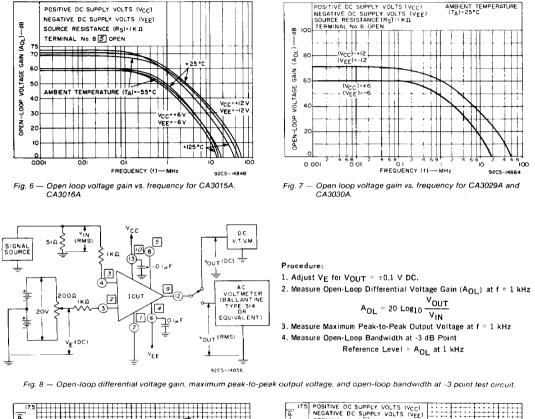

$$I_{10} = V_E [100 \ k\Omega]$$

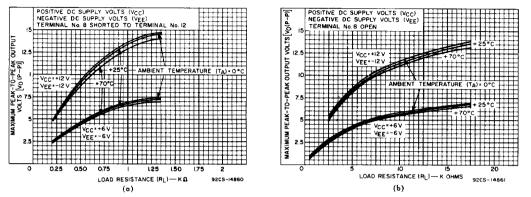

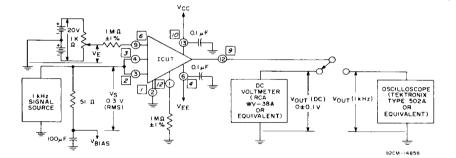

Fig. 10 — Maximum peak-to-peak output voltage vs. load resistance for CA3029A and CA3030A.

#### Procedures:

Common-Mode Rejection Ratio:

- 1. Set  $V_{BIAS} = 0$ . Adjust  $V_E$  for  $V_{OUT}(DC) = 0 \pm 0.1 V$ .
- 2. Apply 1-kHz sinusodial input signal and adjust for  $V_S = 0.3 V$  (RMS).
- (NMS).
  3. Measure and record the RMS value of V<sub>OUT</sub>. An oscilloscope is used for this measurement so that the output signal may be visually separated from noise output.
- 4. Calculate Common-Mode Voltage Gain:

#### ACM = VOUT /VS

 $A_{CM}$  in dB = -20 LOG\_{10} VS/VOUT

5. Calculate Common-Mode Rejection Ratio:

CMR in dB =  $A_{DIFF}$  in dB -  $A_{CM}$  in dB.

Common-Mode Input-Voltage Range;

- Calculate and record CMR for various positive and negative values of V<sub>BIAS</sub> within the maximum limits shown on Page 2. The Common-Mode Input-Voltage Range limits are those values of V<sub>BIAS</sub> at which CMR is 6 dB less than that calculated in Step 5 of the procedure given above.
- Fig. 11 Common-mode rejection ratio and common-mode inputvoltage-range test circuit.
