

SANYO Semiconductors DATA SHEET

BI-CMOS LSI For Digital Still Camera 6-channel Motor Driver IC

Overview

The LV8044LP is a 6-channel motor driver IC for digital still camera.

Functions

- Two microstep drive H-bridge driver channels.
- Two microstep drive/PWM saturated drive switchable H-bridge driver channels.
- Two constant-current drive H-bridge driver channels.
- Drive mode switchable between 2-phase, 1-2 phase full torque, 1-2 phase, and 4W1-2 phase (channels 1, 2, 3, and 4).
- Microstep drive step advance controlled by a single step signal input (channels 1, 2, 3, and 4).
- Ability to set the hold current to one of four levels (channels 1, 2, 3, and 4).
- Ability to set the constant-current reference voltage to one of 16 levels from the serial data (channels 5 and 6).
- Eight-bit 3-wire serial control.
- Three on-chip photosensor driver circuits.

Specifications

Maximum Ratings at $Ta = 25^{\circ}C$

Parameter	Symbol	Conditions	Ratings	Unit
Power supply voltage 1	V _M max		6.0	V
Power supply voltage 2	V _{CC} max		6.0	V
Output peak current	I _O peak	Each CH tw \leq 10ms, duty 20%	600	mA
Output continuous current	I _O max	Each CH	400	mA
Maximum power drain allowed 1	Pd max1	IC proper	0.25	mW
Maximum power drain allowed 2	Pd max2	With substrate *	1.4	mW
Operating temperature	Торд		-20 to +85	°C
Storage temperature	Tstg		-55 to +150	°C

*: With 40mm × 50mm × 0.8mm glass epoxy substrate (four-layer substrate).

- Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.
- Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Serial Data Input Specifications

1. Serial Data Input Setup

First set STB low and then input the SDATA and SCLK signals. The SCLK signal is not accepted when STB is high. SDATA inputs the data in the order D0, D1, ... D6, D7.

Data is transferred on the rising edge of SCLK and after all data has been transferred, all the data is latched on the rising edge of STB.

2. Timing with which the Serial Data Settings are Reflected in the Output

- STP timing mode (applies to microstep driver settings)
- Type 1: The hold, reset, and enable settings, as well as the reference voltage setting are reflected at the same time as the STB signal data latch operation.
- Type 2: The forward/reverse (FR) and the excitation setting mode (MS) setting that are set at STP setup are reflected in the output at the next clock rising edge after data latch.
- STB timing (applies to settings other than the above)

Type 1: The PWM driver, constant-current driver, PI, and other settings are reflected at the same time as the STB signal data latch operation.

STEP			STEP	
STB			STB	
	Data latch timing	STB timing		Data latch timing Reflected at the falling edge
Type 1		×	Type 2	Example: 2-phase excitation

Notes

- *1: This serial data is only accepted when the IN51/IN52 pulse inputs are in the Low/Low states, respectively. It is ignored at all other times.
- *2: This serial data is only accepted when the IN61/IN62 pulse inputs are in the Low/Low states, respectively. It is ignored at all other times.
- *3: When D4 = 1, MO is only output if microstep mode is selected for channels 3 and 4. In PWM mode, this output is held fixed at the high level.
- *4: The MO output can be specified to be the 1-2 phase position only in 4W1-2 phase excitation mode. In all other excitation modes, the MO output position becomes the initial position regardless of the serial data values.

Caand As Ada Ad 20 D There Circuit (Microstep drive stepping mode driver)

STEP1 Pin Function

In	out	On easting and a
ST	STEP1	Operating mode
Low	*	Standby mode
High		Excitation step feed
High	_	Excitation step hold

Excitation Mode Setting (D0 = 0, D1 = 0, D2 = 0)

D3	D4	Excitation mode	Initial position			
D3	D4	Excitation mode	1ch	2ch		
0	0	2 phase excitation	100%	-100%		
1	0	1-2 phase excitation (full torque)	100%	0%		
0	1	1-2 phase excitation	100%	0%		
1	1	4W1-2 phase excitation	0%			

The initial state at power on is the initial position for each excitation mode when the counter is reset.

Reference Voltage Setting Serial Data: (D0 = 0, D1 = 0, D2 = 0)

D5	D6	Current setting reference voltage (When microstep is 100%)
0	0	0.2V
1	0	0.134V
0	1	0.1V
1	1	0.066V

The output current setting reference voltage can be switched between four levels with the serial data. This setting is useful for saving power in the motor powered hold state.

Calculating the Set Current

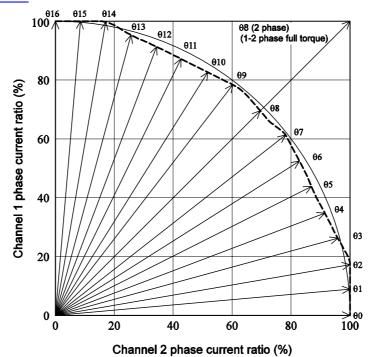

Since the reference voltage can be modified (0.2, 0.134, 0.1, and 0.66V) with the serial data, the output current can be set with the reference voltage and the resistor RF connected between the RF pin and ground.

IOUT = (<reference voltage> × <set current ratio>)/<RF resistor value>

Example: If the reference voltage is 0.2 V, the set current ratio is 100%, and the RF resistor value is 1 Ω , then the output current will be that shown below.

 $I_{OUT}=0.2V\times 100\%/1\Omega=200mA$

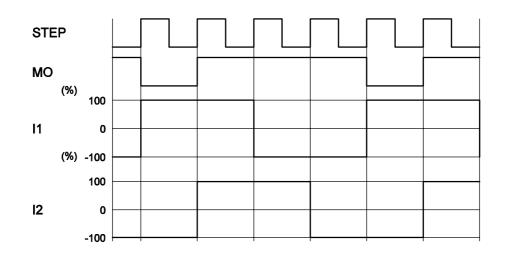

C面前UL C&OrtehP V英中的Locus (With one step normalized to 90 degrees)

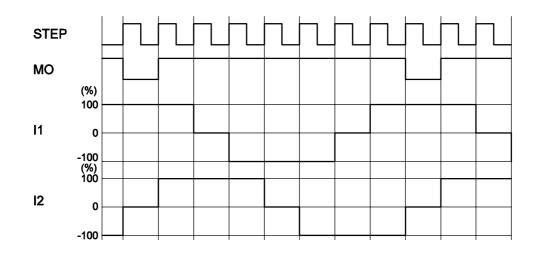

Set Current Ratios in the Different Excitation Modes

C查访此Control ID 供应商n Specifications

• Sine wave increasing direction

• Sine wave decreasing direction

Each of the current modes operates with the follow sequence.

• The IC enters charge mode when the chopping oscillation starts. (A period of charge mode is forcibly present in 1/8 of the period, regardless of which of the coil current (ICOIL) and the set current (IREF) is larger.)

• In charge mode, the coil current (ICOIL) and the set current (IREF) are compared.

If an ICOIL < IREF state exists during the charge period:

The IC operates in charge mode until ICOIL \geq IREF. After that, it switches to slow decay mode and then switches to fast decay mode in the last 1/8 of the period.

If no ICOIL < IREF state exists during the charge period:

The IC switches to fast decay mode and the coil current is attenuated with the fast decay operation until the end of the chopping period.

The above operation is repeated. Normally, in the sine wave increasing direction the IC operates in slow (+fast) decay mode, and in the sine wave decreasing direction the IC operates in fast decay mode until the current is attenuated and reaches the set value and the IC operates in slow decay mode.

Chopping Troductory Setting (D6 and D7 in the serial data)

This IC integrates an internal oscillator circuit and allows the chopping frequency used in constant-current control to be switched with the serial data (111***, D6, D7) setting.

Data D6	Data D7	Chopping frequency
0	0	130KHz
1	0	65KHz
0	1	200KHz
1	1	100KHz

Monitor Output Setting (Serial data bits D3, D4, and D5)

The signal output from the PI3/MO pin can be switched with the serial data (111, D3, ****) setting.

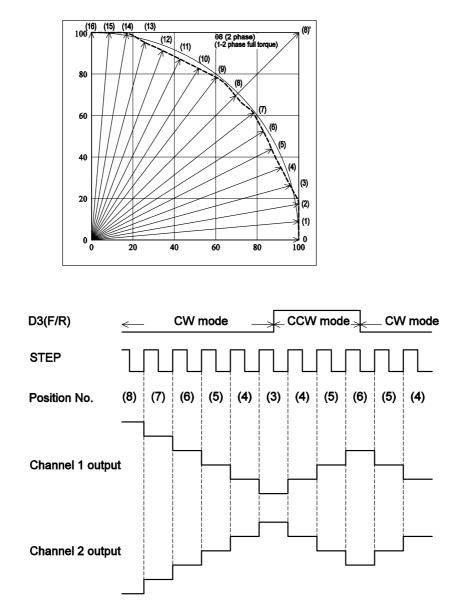

Data D3	PI3/MO pin output
0	Photosensor drive output 3
1	Stepping position detection monitor output

It is also possible to select which of channels 1 and 2 or channels 3 and 4 are output from the monitor pin with the serial data (111*, D4, D5, **) setting. The MO output position used to detect the driver excitation position in microstepping drive mode can also be switched. The state MO = Low is output at the output position.

Data D4	Data D5	Channels 1 and 2 excitation mode	Channels 3 and 4 excitation mode	MO output
0	0	2 phase excitation		Channels 1 and 2 monitor/initial position
0	1			
0	0	1-2 phase excitation		Channels 1 and 2 monitor/initial position
0	1	(full torque)		
0	0	2 phase excitation		Channels 1 and 2 monitor/initial position
0	1			
0	0	4W1-2 phase excitation		Channels 1 and 2 monitor/initial position
0	1			Channels 1 and 2 monitor/1-2 phase position
1	0		2 phase excitation	Channels 3 and 4 monitor/initial position
1	1			
1	0		1-2 phase excitation (full torque)	Channels 3 and 4 monitor/initial position
1	1			
1	0		2 phase excitation	Channels 3 and 4 monitor/initial position
1	1			
1	0		4W1-2 phase excitation	Channels 3 and 4 monitor/initial position
1	1			Channels 3 and 4 monitor/1-2 phase position
1	0		PWM drive mode	Output held fixed at the high level
1	1			Output held fixed at the high level

Basin Set @urtent 供应 ovitching (STEP pin) and Forward/Reverse Switching (D3 in the serial data)

Operations

The IC internal D/A converter advances by 1 bits on the rising edge of the input step pulse.

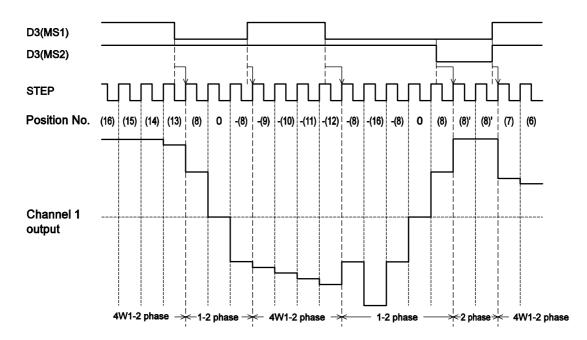

The CW/CCW mode can be switched with the serial data (100, D3, ****) setting. The operation progresses with the position number decreasing in CW mode and increasing in CCW mode.

In CW mode, the channel 2 current phase is delayed by 90 degrees relative to the channel 1 current.

In CCW mode, the channel 2 current phase is advanced by 90 degrees relative to the channel 1 current.

LV8044LP

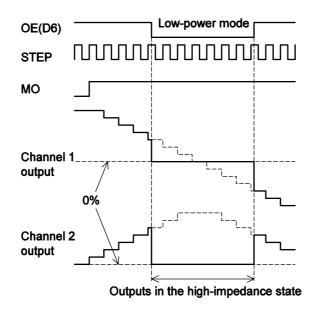

Examilion的AddePS旗向商g During Operation (D3 and D4 in the serial data)

2 phase	(8)'	(7)	0	0	

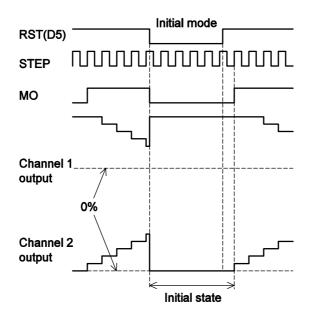

O重t词儿Errandel Ferritation育D6 in the serial data)

When the OE bit in the serial data, D6 (100, ***, D6, *), is set to 0, the output is turned off and set to the high-impedance state at the rise of STB.

Since, however, the internal logic circuits operate in this state, the position number will be advanced if a step input is applied. Therefore, when the OE bit (D6) is returned to 1, a level according to the position number advanced by the step input will be output.

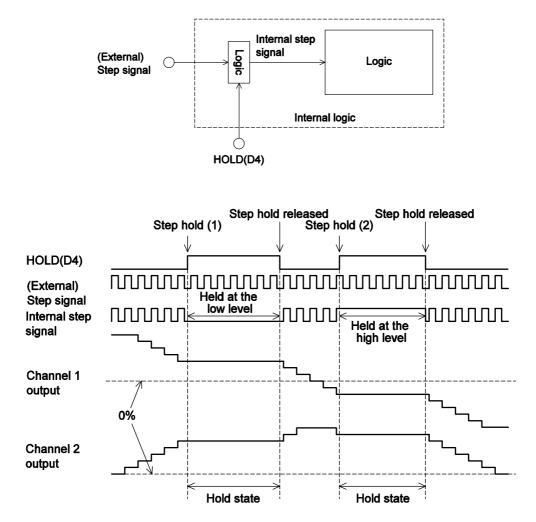

Counter Reset Function (D5 in the serial data)

When the reset bit in the serial data, D5 (100, **, D5, **), is set to 0, the output goes to the initial state at the rise of STB and the MO output goes low.

Then, when the reset bit (D5) is next set to 1, the position number will advance at the next step input.

Solid 形 44 th 的 供 如 裔 the serial data)

When the hold bit in the serial data, D4 (100, *, D4, ***), is set to 1, the external step state at that time is held without change as the internal step state.

Since the (external) step state is low at the timing of the step hold operation (1) in the figure, the internal step state is held at the low level, and since the (external) step state is high at the timing of the step hold operation (1), the internal step state is held at the high level.

When the hold data (D) is set to 0, the internal state is synchronized with the external step signal.

The output is held at the state at the point where the step hold was applied and after the step hold is released, it advances with the timing of the next step input (rising edge).

As long as the IC is in the hold state, the position number does not advance even if external step pulses are applied.

Cation Mand 共 D Ever Circuit (Saturated drive/microstep drive)

Driver Mode Setting (D0 = 0, D1 = 1, D2 = 0)

D7 data value	Drive mode	Pin functions	Notes				
0	Saturated drive	PWM3	Used as the channel 3 PWM input pin				
1	1 Microstep drive		Used as the channels 3 and 4 excitation step input pin				

The channels 3 and 4 driver circuit can be switched between the following operating modes by bit D7 in the serial data (010, ****, D7).

(1) Two saturated mode driver channels

(2) One microstep drive stepping motor driver channel

Microstep Drive Stepping Motor Driver

The basic functionality provided is identical to that of the channels 1 and 2 stepping motor driver. See section 10-2 for details on the serial data settings.

PWM Saturated Mode Driver

*: Don't care

Caamels: 54and均应的ver Circuit (Constant-current drive)

Output Function

When the channels 5 and 6 driver circuit is used to drive an actuator, it can be controlled either from the serial data or from the IN51, IN52, IN61, and IN62 parallel signals.

When the parallel input signals IN51 (IN61)/IN52 (IN62) are in the low/low state (note that since these inputs are pulled down internally in the IC, the open/open state can also be used), the output mode will be determined by the serial data.

If the parallel input signals are in any state other than the above, the serial data will be ignored and the output mode will be determined by the parallel inputs.

Truth Table (Channel 5: D0 = 1, D1 = 0, D2 = 1)

Parallel input		Serial data		Outputs		Mode
IN51	IN52	D3	D4	OUT5A	OUT5B

The constant-current setting for channels 5 and 6 can be set individually for each channel.

(When D3 is 0, channel 5 is set, and when D3 is 1, channel 6 is set.)

The constant-current output value is set by the constant-current reference voltage set with the serial data and the value of the resistor (referred to as "RF" here) connected to the RF5 or RF6 pin. The formula below is used to calculated the constant-current output value.

<Constant-current output level> = <current setting reference voltage>/<RF resistor>

P直荷OSenseLD供应 Gircuit (PI1, PI2, and PI3)

The photosensor drive circuit has open-drain outputs. The output is controlled (set to on or off) by a bit in the serial data (0 or 1).
