

## CY74FCT2240T CY74FCT2244T

SCCS036 - September 1994 - Revised March 2000

## Features

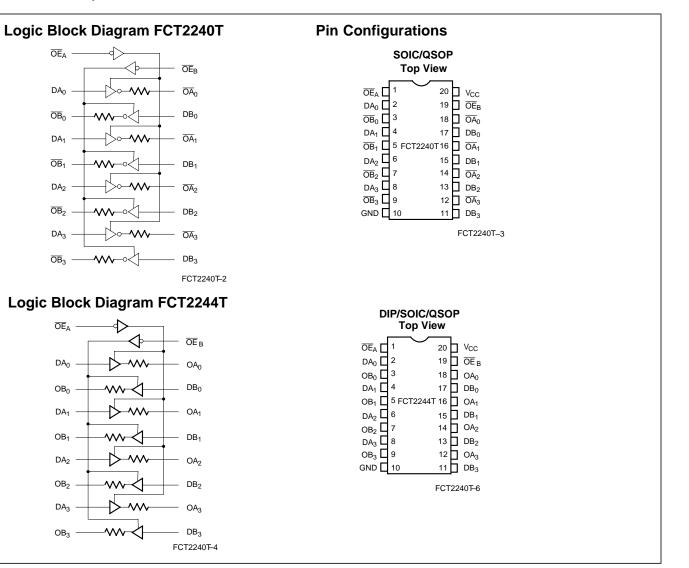

- · Function and pinout compatible with FCT and F logic
- 25 $\Omega$  output series resistors to reduce transmission line reflection noise
- FCT-C speed at 4.1 ns max. (Com'l) FCT-A speed at 4.8 ns max. (Com'l)
- TTL output level versions of equivalent FCT functions
- · Edge-rate control circuitry for significantly improved noise characteristics
- Power-off disable feature permits live insertion
- ESD > 2000V
- · Fully compatible with TTL input and output logic levels
- Sink current 12 mA Source current15 mA
- Extended commercial temp. range of -40°C to +85°C
- Three-state outputs

# 8-Bit Buffers/Line Drivers

### **Functional Description**

The FCT2240T and FCT2244T are octal buffers and line drivers that include on-chip  $25\Omega$  terminating resistors at each of the outputs, to minimize noise resulting from reflections or standing waves in high-performance applications. The on-chip resistors reduce overall board space and component count. Designed to be employed as memory address drivers, clock drivers, and bus-oriented transmitters/receivers, these devices provide speed and drive capabilities commensurate with their fastest bipolar logic counterparts while reducing power dissipation. The input and output voltage levels allow direct interface with TTL, NMOS, and CMOS devices without the need for external components.

The outputs are designed with a power-off disable feature to allow for live insertion of boards.

#### Notes:

1.

2.

H = HIGH Voltage Level. L = LOW Voltage Level. X = Don't Care. Unless otherwise noted, these limits are over the operating free-air temperature range. Unused inputs must always be connected to an appropriate logic voltage level, preferably either V<sub>CC</sub> or ground. T<sub>A</sub> is the "instant on" case temperature. 3

4.

Typical values are at V\_{CC}=5.0V, T\_A=+25  $^\circ\text{C}$  ambient. 5.

6.

This parameter is specified but not tested. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests,  $I_{OS}$  tests should be performed last. 7.

Notes:

Notes: 8. Per TTL driven input ( $V_{IN}$ =3.4V); all other inputs at  $V_{CC}$  or GND. 9. This parameter is not directly testable, but is derived for use in Total Power Supply calculations. 10.  $I_C = I_{QUIESCENT} + I_{INPUTS} + I_{DYNAMIC}$   $I_C = I_{CC} + \Delta [_{CC}D_H N_T + I_{CCD} [(f_0/2 + f_1 N_1))]$   $I_{CC} = Quiescent Current with CMOS input levels$   $\Delta I_{CC} = Power Supply Current for a TTL HIGH input (<math>V_{IN}$ =3.4V)  $D_H = Duty Cycle for TTL inputs HIGH$   $N_T = Number of TTL inputs at <math>D_H$   $I_{CCD} = Dynamic Current caused by an input transition pair (HLH or LHL)$  $<math>f_0 = Clock$  frequency for registered devices, otherwise zero

f<sub>0</sub> = Clock frequency for registered devices, otherwise zero

- f<sub>1</sub> N<sub>1</sub> = Input signal frequency
- = Number of inputs changing at f1

All currents are in millions and all frequencies are in megahertz. 11. Values for these conditions are examples of the I<sub>CC</sub> formula. These limits are specified but not tested.
