## 4-Bit Single Chip Microcomputer

**On-Chip FLT Controller, A/D Converter,  
Remote Control Signal Detector, 16K-Byte ROM**

©3106

**Overview**

The LC67216A is a 4-bit single chip microcomputer fabricated with CMOS technology. It includes CPU (operational speed: 0.92  $\mu$ s), ROM (16K bytes), RAM (608 words), AD converter, DA converter (PWM type), Remote control signal receiver, FLT display controller/driver, and horizontal synchronization detect counter in a 64-pin package.

**Applications:**

- VCR timer, audio timer, DSP amp controller

**Features:**

- (1) Dedicated hardware: Simpler program and more additional values
  - FLT display controller/driver  $\rightarrow$  Total 28 lines (max.): 20 segments and 16 digits (max.), Various display modes (dimmer, static, and so on), and automatic scanner function (no interrupt processing required)
  - Remote control signal receiver  $\rightarrow$  Continuous pulse (L, H) detection by remote control detection timer and internal high-frequency band noise elimination filter. Recommended for use in products with the 'Association of home electronic appliances' standards.
  - Tone output  $\rightarrow$  Beep sound and melody tone outputs
  - Horizontal synchronization detect counter  $\rightarrow$  Tuner synchronization detectable by an independent 9-bit counter
  - PWM type DA converter  $\rightarrow$  14-bit DAC output, voltage synthesizer tuner and electronic volume control
- (2) AD converter: Lower cost, more additional values and higher functionality
  - Direct input of various analog signals  $\rightarrow$  AD conversion for level meter and display, S curve detect  $\rightarrow$  no dedicated IC required.
  - key matrix input by resistance division  $\rightarrow$  Better economical space layout, less pins count, reduced harness and improved radiation immunity
- (3) Protection against noise radiation
  - Improved protection against noises from oscillation circuit or FLT driving circuit  $\rightarrow$  Shortened noise protection design process and parts reduction in noise protection mechanism
- (4) Clock standby function
  - Two types of oscillation circuits (4MHz band and 32KHz band)  $\rightarrow$  Battery-backed-up clock application

**Hardware Configuration**

Applicable to: LC66000 series/LC67000 series microcomputers

Model name	LC66506B/508B/512B/516B	LC66304A/306A/308A	LC67216A
ROM capacity	6K/8K/12K/16K bytes	4K/6K/8K bytes	16K bytes
RAM capacity	512 $\times$ 4	512 $\times$ 4	608 $\times$ 4 (96 $\times$ 4 for display)
Packaging	DIP64S, QIP64	DIP42S	DIP64S
High withstand voltage port	Not provided.	Not provided.	Provided (28 lines)
Analog input	Comparator (4 channels) Tri-state input (2 channels)	Comparator (4 channels) Tri-state input (2 channels)	AD converter with an accuracy of 4 bits (8 channels)
Evaluation chip	LC66599	LC66599	LC67999
Remarks	Currently on the market	Currently under development	Currently on the market

LC67216A

[查询"LC67216A"供应商](#)

Functions:

- (1) Instructions: 116 (upwards compatible with the LC66000 series microcomputers)
- (2) ROM capacity: 16K bytes, RAM capacity: 608x 4 words (of the capacity, 96 x 4 words used as the display RAM)
- (3) Minimum cycle time: 0.92  $\mu$ s at 4.5V to 6.0V, 7.6  $\mu$ s at 3.0V to 6.0V
- (4) System clock selectable by a software  $\rightarrow$  Less power dissipation
  - In case of main system clock = 4.19MHz: 0.95, 7.6 or 30.6  $\mu$ s
  - In case of sub system clock = 32.768KHz: 61  $\mu$ s
- (5) Input/output ports: Total = 53 lines
  - Output ports: 28 lines  $\rightarrow$  FLT controller directly drivable
  - Input/output ports: 24 lines  $\rightarrow$  LED directly drivable
  - Input port: 1 line
- (6) Interrupt: 11 sources (external interrupt = 4 lines, AC zero cross interrupt = 1 line, timer interrupt = 3 lines, serial input/output interrupt = 2 lines, and key scan interrupt = 1 line), 6 vector addresses.
- (7) Timer: 3-channel multiple-functional timer
  - Timer 1: Remote control signal receiver/8-bit interval + tone generator
  - Timer 2: PWM type DA converter(14 bits or 8 bits + 6 bits)/tone generator
  - Time base timer: Clock counter(also used as a watchdog timer)/14-bit event counter
- (8) Serial input/output: 8 bits x 2 channels. One of them can be used as the LSB-first or the MSB-first serial transfer port.
- (9) 4-bit 8-channel AD converter: AD conversion mode/comparator mode
- (10) FLT display controller
  - Segments: 8 to 20, Digits: 8 to 16  $\rightarrow$  Selectable by software.
  - 8-level dimmer function
  - Pull-down resistor option available
  - Static display mode available
- (11) On-chip 9-bit counter for detecting horizontal sync.
- (12) On-chip AC zero cross detector
- (13) On-chip triac driver
- (14) Standby function
  - Count operation continues while the CPU operation stops.
  - All of the operations stop. Oscillation stabilization at the restart is internally supported.
- (15) Oscillation circuits: 2
  - Main clock: 4.19MHz crystal oscillator or 4.0MHz ceramic resonator
  - Sub clock: 32.768kHz crystal oscillator
- (16) Packaging: DIP64S
- (17) Evaluation LSI: LC67999(evaluation chip) + EVA850/800 - TB67216(evaluation chip board), LC67PG216 (piggyback type)

## Development Support System

The following development support tools are provided to develop application programs for the LC67216A microcomputer.

## (1) User's Manual

LC67216A User's Manual

## (2) Development Tool Manual

EVA850/800-LC67216 Development Tool Manual

## (3) Development Support Tools

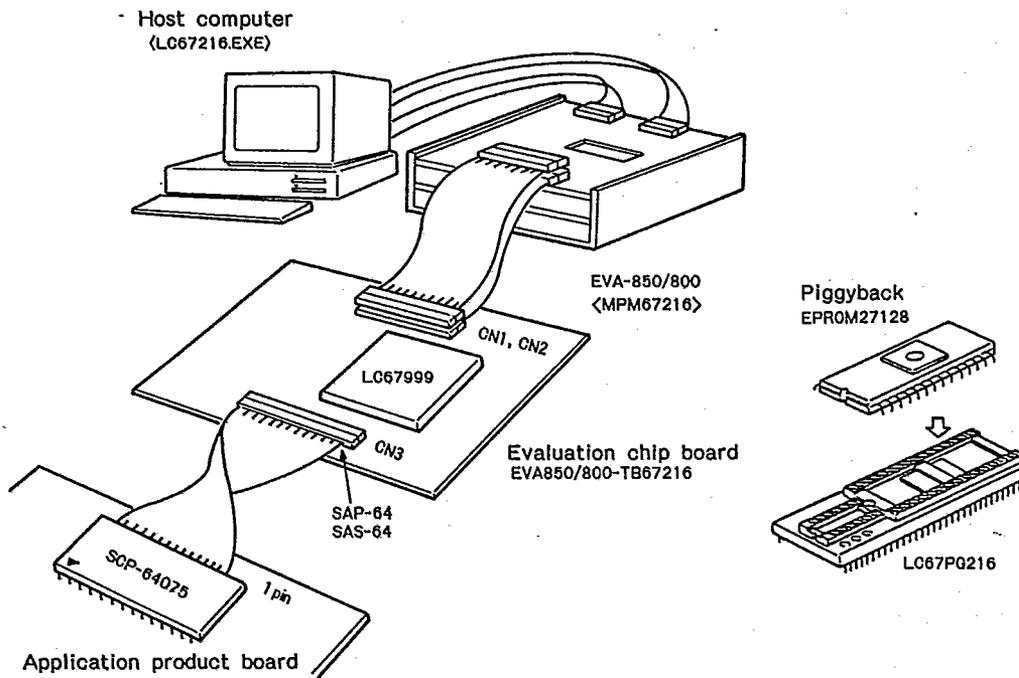

## 1 Tools for developing application programs

- i. Host computer --- Sanyo MS-DOS machine compatible with IBM PC/XT or IBM PC/AT.
- ii. Cross Assembler --- MS-DOS based cross assembler (LC67216.EXE)

## 2 Tools for evaluating application programs

- i. Emulator --- EVA-850 main unit or EVA-800 main unit (monitor ROM: MPM67216) and EVA chip board (EVA850/800-TB67216)
- ii. Evaluation chip --- LC67999
- iii. Simulation chip --- LC67PG216

## Outline of the development support system

Note 1: IBM PC/XT and IBM PC/AT are products of IBM Corporation. MS-DOS is a registered trademark of Microsoft Corporation.

Note 2: The suffixes of the EVA-850 and EVA-800 change like A to B, B to C, and so on as some improvements are made on them.

Please check the suffix before starting program evaluation.

Pin Description

Pin No	Pin name	I/O	Function(s)	Pin No	Pin name	I/O	Function(s)
1	AV+	-	AD conversion reference voltage input (+)	33	S9	O	Pch high withstand voltage output (for segment)
2	AV-	-	AD conversion reference voltage input (-)	34	S10	O	Same as above.
3	P20/HOLD	I	Input/HOLD control input	35	S11	O	Same as above.
4	P21/ACZ/AN1	I/O	Input/output, also used as AC zero cross input/AD input	36	S12	O	Same as above.
5	P22/AN2	I/O	Input/output, also used as AD input.	37	S13	O	Same as above.
6	P23/INT1/AN3	I/O	Input/output, also used as Interrupt input/AD input	38	S14	O	Same as above.
7	P30/S11/AN4	I/O	Input/output, also used as serial input/AD input.	39	S15	O	Same as above.
8	P31/SO0/AN5	I/O	Input/output, also used as serial output/AD input.	40	Vp	-	Power supply for pull-down resistors
9	P32/SCK0/AN6	I/O	Input/output, also used as serial clock input/output or AD input.	41	T15/S16	O	Pch high withstand voltage output (for digit/segment)
10	P33/PIN1/AN7	I/O	Input/output, also used as remote control signal input/AD input.	42	T14/S17	O	Same as above.
11	P40/AN8	I/O	Input/output, also used as AD input.	43	T13/S18	O	Same as above.
12	Vss	-	Power supply (-)	44	T12/S19	O	Same as above.
13	OSC1	I	Main clock oscillation input	45	T11/S20	O	Same as above.
14	OSC2	O	Main clock oscillation output	46	T10/S21	O	Same as above.
15	Vdd	-	Power supply (+)	47	T9/S22	O	Same as above.
16	RES	I	Reset input	48	T8/S23	O	Same as above.
17	X1	I	Sub clock oscillation input	49	T7	O	Pch high withstand voltage output (for digit)
18	X2	O	Sub clock oscillation output	50	T6	O	Same as above.
19	TEST	I	Test input	51	T5	O	Same as above.
20	P50/S11	I/O	Nch medium withstand voltage input/output, also used as serial input.	52	T4	O	Same as above.
21	P51/SO1	I/O	Nch medium withstand voltage input/output, also used as serial output.	53	T3	O	Same as above.
22	P52/SCK1	I/O	Nch medium withstand voltage input/output, also used as serial clock input/output	54	T2	O	Same as above.
23	P53/HCNT	I/O	Nch medium withstand voltage input/output, also used as H counter input.	55	T1	O	Same as above.
24	P60	I/O	Nch medium withstand voltage input/output	56	T0	O	Same as above.
25	P61/EINT0	I/O	Nch medium withstand voltage input/output, also used as Interrupt input	57	P00/KEY0	I/O	Nch medium withstand voltage input/output, also used as key scan input.
26	P62/EINT1	I/O	Same as above	58	P01/KEY1	I/O	Same as above.
27	P63/EINT2	I/O	Same as above	59	P02/KEY2	I/O	Same as above.
28	S4	O	Pch high withstand voltage output (for segment)	60	P03/KEY3	I/O	Same as above.
29	S5	O	Same as above.	61	P10/DAC0	I/O	Nch medium withstand voltage input/output, also used DA output.
30	S6	O	Same as above.	62	P11/DAC1	I/O	Nch medium withstand voltage input/output, also used DA output.
31	S7	O	Same as above.	63	P12/TRA /POUT1	I/O	Nch medium withstand voltage input/output, also used trisc output/pulse output.
32	S8	O	Same as above.	64	P13/BUZ	I/O	Nch medium withstand voltage input/output, also used as buzzer sound output.

Pin Function

Pin name	g	I/O	Option(s)	Functional description	Logic and mode at reset	Unused pin handling
VDD	1	—	—	Power supply	—	—
VSS	1	—	—		—	—
Vp	1	—	—	Power supply for high withstand voltage pin load	—	Connected to VDD.
AV+	1	—	—	AD converter reference voltage input	—	Connected to VSS.
AV-	1	—	—		—	
TEST	1	I	—	LSI test input. Be sure to connect this with VSS.	—	Always connected to VSS.
RES	1	I	—	System reset input. With HOLD = 'H' and RES = 'L', the system will be initialized (initial system reset).	—	—
OSC1	1	I	• CF • X'tal	Main system clock oscillation circuit pin. If external clock input is selected, leave the OSC2 pin open and use the OSC1 input pin.	—	—
OSC2	1	O	• External Input			
X1	1	I	—	Sub clock oscillation circuit pin. If external clock input is selected, leave the X2 pin open and use the X1 input pin. With on-chip feedback resistor and damping resistor.	—	Connect X1 to VDD while leave X2 open.
X2	1	O	—			
P00/KEY0 P01/KEY1 P02/KEY2 P03/KEY3	4	I/O	• Pull-up/open drain output (in bit units) • Pull-down resistor (in-bit units)	Input/output in bit units or 4-bit units. Output circuit type can be selected for each pin from open drain (OD) and pull-up MOS output (PU) types. If OD is selected, the withstand voltage level will be +15V. Low threshold level input for key scan input. Automatic key data storage into RAM	'H' in output mode	Connect OD pin to VSS while leave the PU pin open.
P10/DAC0 P11/DAC1 P12/TRA /POUT1 P13/BUZ	4	I/O	• Pull-up/open drain output (in bit units)	Input/output in bit units or 4-bit units. Output circuit type can be selected for each pin from open drain (OD) and pull-up MOS output (PU) types. If OD is selected, the withstand voltage level will be +15V.  Alternative pin function(s) DAC0 PWM DAC0 output from timer 2 DAC1 PWM DAC1 output from timer 2, and program pulse output  TRA Triac control pulse output, or program pulse output from timer 1 /POUT1 BUZ Buzzer output from time base timer	'H' in output mode	Connect OD pin to VSS while leave the PU pin open.
P20/HOLD	4	I	—	Input/output in bit units or 4-bit units. A direction register is provided to set an operation mode (input mode or output mode) for each port bit. The P20/HOLD pin is used only as the input pin.  Alternative pin function(s) HOLD HOLD control input and reset inhibit input ACZ AC zero cross detect input INT1 Interrupt input AN1 AD converter channel 1 input AN2 AD converter channel 2 input AN3 AD converter channel 3 input	Input mode	Connected to VDD. The pins already connected to VDD should not be set to the output mode by software.
P21/ACZ/AN1		I/O				
P22/AN2		I/O				
P23/INT1/AN3		I/O				
P30/SI0/AN4 P31/SO0/AN5 P32/SCK0 /AN6 P33/PIN1/AN7	4	I/O	—	Input/output in bit units or 4-bits units. A direction register is provided to set an operation mode (input mode or output mode) for each port bit.  Alternative pin function(s) SI0 Serial I/O channel 0 → Serial data input SO0 Serial I/O channel 0 → Serial data output SCK0 Serial I/O channel 0 → Serial clock input/output PIN1 External interrupt source input (timer 1 and time base timer)  AN4 AD converter channel 4 input AN5 AD converter channel 5 input AN6 AD converter channel 6 input AN7 AD converter channel 7 input	Input mode	Connected to VDD. Note that the pins already connected to VDD should not be set to the output mode by software.

Pin name	I/O	Option(s)	Functional description	Logic and mode at reset	Unused pin handling
P40/AN8	I/O	---	Input/output in bit units. A direction register is provided to set an operation mode (input mode or output mode) for each port bit. Alternative pin function AN8 AD converter channel 8 Input	Input mode	Connected to VDD. Note that the pins already connected to VDD should not be set to the output mode by software.
P50/S11 P51/SO1 P52/SCK1 P53/HCNT	I/O	• Pull-up/open drain output (in bit units)	Input/output in bit units or 4-bit units. Output circuit type can be selected for each pin from open drain (OD) and pull-up MOS output (PU) types. If OD is selected, the withstand voltage level will be +15V. A port control register is provided to set an operation mode (input mode or output mode) for all the four port pins at the same time. Alternative pin function(s) S11 Serial I/O channel 1 → Serial data Input SO1 Serial I/O channel 1 → Serial data output SCK1 Serial I/O channel 1 → Serial clock Input/output HCNT H counter count Input	Input mode	Connect the OD pin to VSS while leave the PU pin open.
P60 P61/EINT0 P62/EINT1 P63/EINT2	I/O	• Pull-up/open drain output (in bit units)	Input/output in bit units or 4-bit units. Output circuit type can be selected for each pin from open drain (OD) and pull-up MOS output (PU) types. If OD is selected, the withstand voltage level will be +15V. Alternative pin function(s) EINT0 Extended interrupt input EINT0 EINT1 Extended interrupt input EINT1 EINT2 Extended interrupt input EINT2	H' in output mode	Same as above.
S4~S7	O	Pull-down resistor (in bit units)	Segment outputs from an FLT controller (S4 to S7). If static display mode is selected, these output pins are used to output data to an external circuit from a fixed RAM address (general discrete output).	L' in output mode	Leave the pull-down type pins open while connect the OD type pins to VDD.
S8~S15	O	Pull-down resistor (in bit units)	Segment outputs from an FLT controller (S8 to S15). If static display mode is selected, these output pins are used to output data to an external circuit from fixed RAM addresses (general discrete output).	L' in output mode	Same as above.
T0~T7	O	Pull-down resistor (in bit units)	Timing signal outputs from an FLT controller (T0 to T7). If static display mode is selected, these output pins are used to output data to an external circuit from fixed RAM addresses (general discrete output).	L' in output mode	Same as above.
T8/S23~ T15/S16	O	Pull-down resistor (in bit units)	Timing signal/segment outputs from an FLT controller (alternate output pins). If static display mode is selected, these output pins are used to output data to an external circuit from fixed RAM addresses (general discrete output). In addition, unused pins are used for the same purpose.	L' in output mode	Same as above.

User Options

① Options for main clock oscillation circuits

Option name	Related pins	Oscillation circuit type	Circuit conditions
External clock option	OSC1, OSC2		<ul style="list-style-type: none"> <li>- Internal clock input with Schmitt specification</li> <li>- Leave the OSC2 pin open.</li> </ul>
Ceramic (CF) resonator oscillation option			<ul style="list-style-type: none"> <li>- Rf is a feedback resistor.</li> <li>- Internal clock input with Schmitt specification</li> </ul>
Crystal (X'tal) oscillation option			

② Options for sub clock oscillation circuits

Option name	Related pins	Oscillation circuit type	Circuit conditions
Crystal (X'tal) oscillation option	X1, X2		<ul style="list-style-type: none"> <li>- Rf is a feedback resistor.</li> <li>- Rd is a damping resistor.</li> </ul>
External clock option			<ul style="list-style-type: none"> <li>- Leave the X2 pin open.</li> </ul>
No sub clock oscillation circuit			<ul style="list-style-type: none"> <li>- Connect the X1 pin to VDD.</li> <li>- Leave the X2 pin open.</li> </ul>

[查询"LC67216A"供应商](#)

③ Options for port 0 input pull-down resistor (in 4-bit units)

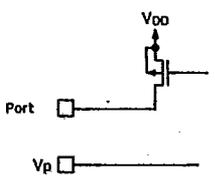

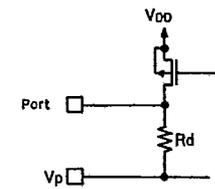

Option name	Related pins	Oscillation circuit type	Circuit conditions
No pull-down resistor selected	P00~P03		
Pull-down resistor selected			- The pull-down resistor has been selected. Note that the pull-down resistor option can be used independently of the pull-up (PU) transistor output option.

④ Options for output circuit types of medium withstand voltage ports (in bit units)

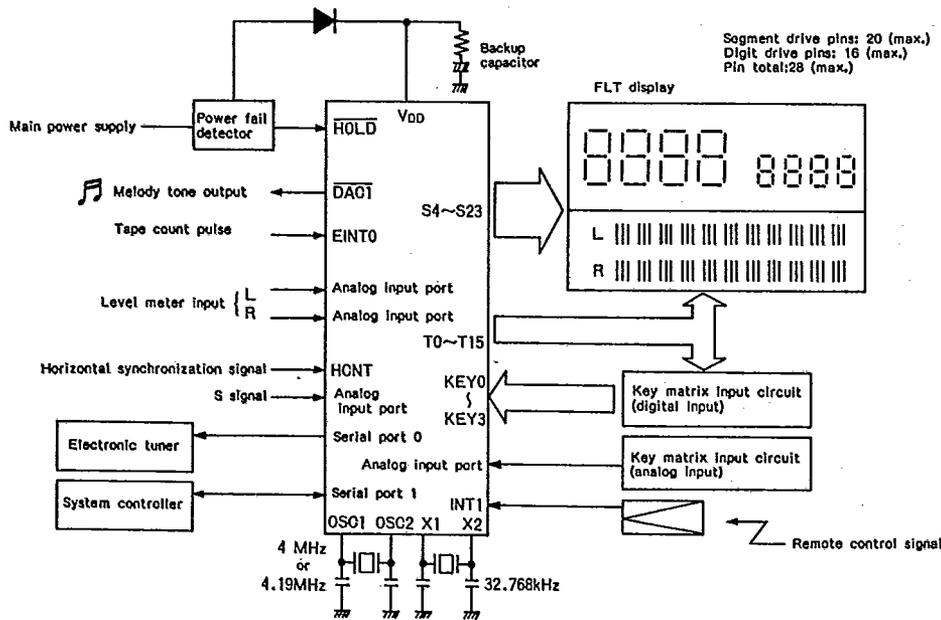

Option name	Related pins	Oscillation circuit type	Circuit conditions
Nch open drain output (OD)	P00~P03 P10~P13 P50~P53 P60~P63		Input/output withstand voltage level = +15V
Pull-up transistor output (PU)			Input/output withstand voltage level = $V_{DD} + 0.3V$ . The output types can be divided into two according to Pch transistor driving capability: CMOS output (P1 and P5) and PU MOS output (P0 and P6).

[查询"LC67216A"供应商](#)

⑤ Options for the output types of high withstand voltage ports (in bit units)

Option name	Related pins	Oscillation circuit type	Circuit conditions
Pch open drain output (OD)	T0~T7 T8/S23~T15/S16 S4~S15		
Output with a pull-down resistor (PD)			

Example application

Example application: VCR channel select timer, level meter, tape counter, and remote control signal receiver

Instruction Set

Instruction group	Mnemonic		Op code		Byte	Cycles	Operations	Operations description	Affected flag(s)	Remarks
			D <sub>7</sub> D <sub>6</sub> D <sub>5</sub> D <sub>4</sub>	D <sub>3</sub> D <sub>2</sub> D <sub>1</sub> D <sub>0</sub>						
Accumulator Manipulation Instructions	CLA	Clear AC	1 0 0 0	0 0 0 0	1	1	AC ← 0 (same as LAI 0)	Clear the AC.	ZF	Note 1
	DAA	Decimal adjust AC in addition	1 1 0 0 0 0 1 0	1 1 1 1 0 1 1 0	2	2	AC ← (AC) + 6 (same as ADI 6)	Add 6 to the AC.	ZF	
	DAS	Decimal adjust AC in subtraction	1 1 0 0 0 0 1 0	1 1 1 1 1 0 1 0	2	2	AC ← (AC) + 10 (same as ADI 0AH)	Add 10 to the AC.	ZF	
	CLC	Clear CF	0 0 0 1	1 1 1 0	1	1	CF ← 0	Clear the CF (Carry Flag).	CF	
	STC	Set CF	0 0 0 1	1 1 1 1	1	1	CF ← 1	Set the CF.	CF	
	CMA	Complement AC	0 0 0 1	1 0 0 0	1	1	AC ← (AC)	Complement the AC.	ZF	
	IA	Increment AC	0 0 0 1	0 1 0 0	1	1	AC ← (AC) + 1	Increment the AC by 1.	ZF, CF	
	DA	Decrement AC	0 0 1 0	0 1 0 0	1	1	AC ← (AC) - 1	Decrement the AC by 1.	ZF, CF	
	RAR	Rotate AC right through CF	0 0 0 1	0 0 0 0	1	1	AC <sub>n</sub> ← (CF), AC <sub>n-1</sub> ← (AC <sub>n</sub> )	Rotate the AC right through the CF.	CF	
	RAL	Rotate AC left through CF	0 0 0 0	0 0 0 1	1	1	AC <sub>0</sub> ← (CF), AC <sub>n</sub> ← (AC <sub>0</sub> )	Rotate the AC left through the CF.	CF, ZF	
	TAE	Transfer AC to E	0 1 0 0	0 1 0 1	1	1	E ← (AC)	Transfer the AC content to the E register.		
	TEA	Transfer E to AC	0 1 0 0	0 1 1 0	1	1	AC ← (E)	Transfer the E register content to the AC.	ZF	
	XAE	Exchange AC with E	0 1 0 0	0 1 0 0	1	1	(AC) ↔ (E)	Exchange the AC content with the E register content.		
Memory Manipulation Instructions	IM	Increment M	0 0 0 1	0 0 1 0	1	1	M(MBR, HL) ← (M(MBR, HL)) + 1	Increment the content of M(MBR, HL) by 1.	ZF, CF	
	DM	Decrement M	0 0 1 0	0 0 1 0	1	1	M(MBR, HL) ← (M(MBR, HL)) - 1	Decrement the content of M(MBR, HL) by 1.	ZF, CF	
	IMDR i8	Increment M direct	1 1 0 0 i <sub>7</sub> i <sub>6</sub> i <sub>5</sub> i <sub>4</sub>	0 1 1 1 i <sub>3</sub> i <sub>2</sub> i <sub>1</sub> i <sub>0</sub>	2	2	M(MBR, i8) ← (M(MBR, i8)) + 1	Increment the content of M(MBR, i8) by 1. i8 is 8-bit immediate data.	ZF, CF	
	DMDR i8	Decrement M direct	1 1 0 0 i <sub>7</sub> i <sub>6</sub> i <sub>5</sub> i <sub>4</sub>	0 0 1 1 i <sub>3</sub> i <sub>2</sub> i <sub>1</sub> i <sub>0</sub>	2	2	M(MBR, i8) ← (M(MBR, i8)) - 1	Decrement the content of M(MBR, i8) by 1. i8 is 8-bit immediate data.	ZF, CF	
	SMB i2	Set M data bit	0 0 0 0	1 1 i <sub>1</sub> i <sub>0</sub>	1	1	(M(MBR, HL), i2) ← 1	Set a specified bit of the content of M(MBR, HL). Note that the two LSBs are used to specify the bit.		
	RMB i2	Reset M data bit	0 0 1 0	1 1 i <sub>1</sub> i <sub>0</sub>	1	1	(M(MBR, HL), i2) ← 0	Reset a specified bit of the content of M(MBR, HL). Note that the two LSBs are used to specify the bit.	ZF	
Operations and Comparison Instructions	AD	Add M to AC	0 0 0 0	0 1 1 0	1	1	AC ← (AC) + (M(MBR, HL))	Add the AC content and that of the M(MBR, HL) together in binary and then store the resulted sum into the AC.	ZF, CF	
	ADDR i8	Add M direct to AC	1 1 0 0 i <sub>7</sub> i <sub>6</sub> i <sub>5</sub> i <sub>4</sub>	1 0 0 1 i <sub>3</sub> i <sub>2</sub> i <sub>1</sub> i <sub>0</sub>	2	2	AC ← (AC) + (M(MBR, i8))	Add the AC content and that of the M(MBR, i8) together in binary and then store the resulted sum into the AC. i8 is 8-bit immediate data.	ZF, CF	
	ADC	Add M to AC with CF	0 0 0 0	0 0 1 0	1	1	AC ← (AC) + (M(MBR, HL)) + (CF)	Add the AC content and those of the M(MBR, HL) and the carry flag (CF) together in binary and then store the resulted sum into the AC.	ZF, CF	
	ADI i4	Add immediate data to AC	1 1 0 0 0 0 1 0	1 1 1 1 i <sub>3</sub> i <sub>2</sub> i <sub>1</sub> i <sub>0</sub>	2	2	AC ← (AC) + i <sub>3</sub> i <sub>2</sub> i <sub>1</sub> i <sub>0</sub>	Add the AC content and immediate data in binary and then store the resulted sum into the AC.	ZF	
	SUBC	Subtract AC from M with CF	0 0 0 1	0 1 1 1	1	1	AC ← (M(MBR, HL)) - (AC) - (CF)	Subtract the AC content plus the inverted CF content from the M(MBR, HL) content in binary and then store resulted difference into the AC.	ZF, CF	If there has been a borrow, the carry flag (CF) is set to '0'. Otherwise, the flag is set to '1'.
	ANDA	And M with AC then store AC	0 0 0 0	0 1 1 1	1	1	AC ← (AC) ∧ (M(MBR, HL))	Logically AND the M(MBR, HL) content with the AC content and then store the resulted logical product into the AC.	ZF	
	ORA	Or M with AC then store AC	0 0 0 0	0 1 0 1	1	1	AC ← (AC) ∨ (M(MBR, HL))	Logically OR the M(MBR, HL) content with the AC content and then store the resulted logical sum into the AC.	ZF	
	EXL	Exclusive or M with AC then store AC	0 0 0 1	0 1 0 1	1	1	AC ← (AC) ⊕ (M(MBR, HL))	Logically X-AND the M(MBR, HL) content with the AC content and then store the resulted logical product into the AC.	ZF	
ANDM	And M with AC then store M	0 0 0 0	0 0 1 1	1	1	M(MBR, HL) ← (AC) ∧ (M(MBR, HL))	Logically AND the M(MBR, HL) content with the AC content and then store the resulted logical product into the M(MBR, HL).	ZF		
ORM	Or M with AC then store M	0 0 0 0	0 1 0 0	1	1	M(MBR, HL) ← (AC) ∨ (M(MBR, HL))	Logically OR the M(MBR, HL) content with the AC content and then store the resulted logical sum into the M(MBR, HL).	ZF		

Note 1: If multiple CLA instructions are used in a row, only the execution of the instructions following the first CLA can be skipped.

Option code specification for the LC67216A microcomputer

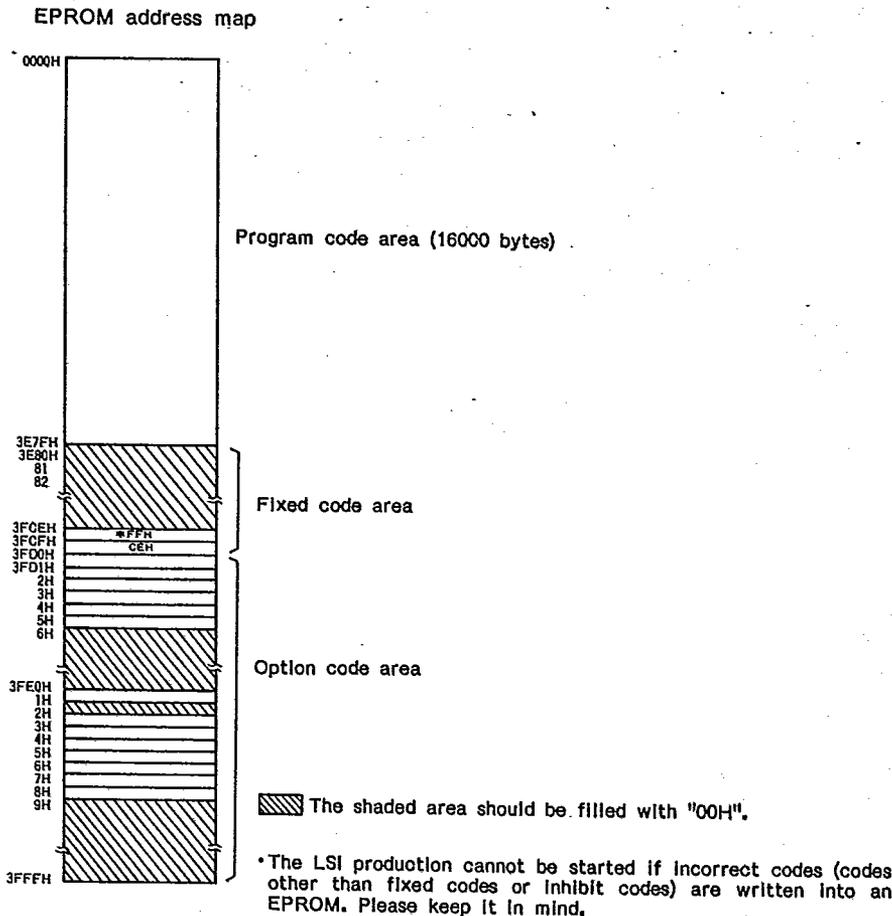

The EPROM which is to be sent to Sanyo should contain various mask option codes and program codes for the LC67216A microcomputer.

In order to write option codes into the EPROM, we provide the LC67216A cross assembler. This cross assembler would enable the user to enter the option codes in interactive operation mode.

In case where the cross assembler provided by Sanyo is not used for the above purpose, the required option codes should be entered in the following manner. If you enter the codes in the manner, the same option codes as those generated by the LC67216A cross assembler can be set in the EPROM.

When placing your order, please provide us with an option code list and the EPROM (27128) containing program codes and option codes.

For detailed information on the option codes, please refer to section 9, "Specifying User Options" of the manual, 'EVA850/800-LC67216 Development Tool Manual'. However, the main clock oscillation circuit option for the RC (resistor- capacitor) oscillation is not provided for the LC67216A microcomputer. Please keep it in mind.

Notes on the evaluation of user programs for the LC67216A microcomputer

If the user programs for the LC67216A microcomputer are evaluated on the evaluation chip (LC67999 or LC67PG216), please read carefully section 5.3 "considerations in Program Evaluation" of the 'LC67216A User's Manual'. In addition, please keep in mind the following cautions.

Notes on program code area: The program code area of the production chip is 16000 bytes in size. That is, its address starts from address 0000H, ending at address 3E7FH. However, the accessible area of an evaluation chip is in the range between address 0000H and address 3FFFH. That is, it can be said that the program code area of the evaluation chip is 16383 bytes in size. As a result, the code area after address 3E80H should not be used for storing program codes. Please keep the following two points in mind.

- (1) No program codes in the area after address 3E80H.
- (2) No program jump to the area after address 3E80H.
