SCAS892B – FEBRUARY 2010 – REVISED MAY 2010

PROGRAMMABLE 3-PLL VCXO CLOCK SYNTHESIZER
WITH 1.8-V, 2.5-V, AND 3.3-V LVCMOS OUTPUTS

Check for Samples: CDCE937-Q1, CDCEL937-Q1

FEATURES

- **Qualified for Automotive Applications**
- **Member of Programmable Clock Generator Family**
  - **CDCE913/CDCEL913: 1-PLL, 3 Outputs**
  - **CDCE925/CDCEL925: 2-PLL, 5 Outputs**
  - *CDCE937/CDCEL937: 3-PLL, 7 Outputs*
  - **CDCE949/CDCEL949: 4-PLL, 9 Outputs**
- **In-System Programmability and EEPROM**
  - **Serial Programmable Volatile Register**
  - **Nonvolatile EEPROM to Store Customer Setting**
- **Flexible Input Clocking Concept**
  - **External Crystal: 8 MHz to 32 MHz**
  - **On-Chip VCXO: Pull Range ±150 ppm**
  - **Single-Ended LVCMOS up to 160 MHz**
- **Selectable Output Frequency up to 230 MHz**
- **Low-Noise PLL Core**
  - **Integrated PLL Loop Filter Components**
  - **Low Period Jitter (Typ 60 ps)**
- **Separate Output Supply Pins**
  - **CDCE937: 3.3 V and 2.5 V**
  - **CDCEL937: 1.8 V**

- **1.8-V Device Power Supply**
- **Flexible Clock Driver**
  - **Three User-Definable Control Inputs [S0/S1/S2]; e.g., SSC Selection, Frequency Switching, Output Enable or Power Down**
  - **Generates Highly Accurate Clocks for Video, Audio, USB, IEEE1394, RFID, Bluetooth™, WLAN, Ethernet™, and GPS**
  - **Generates Common Clock Frequencies Used With TI DaVinci™, OMAP™, DSPs**
  - **Programmable SSC Modulation**
  - **Enables 0-PPM Clock Generation**
- **Latch-Up Performance Meets 100 mA Per JESD 78, Class I**
- **Wide Temperature Range –40° C to 125° C**
- **Packaged in TSSOP**
- **Development and Programming Kit for Easy PLL Design and Programming (TI Pro-Clock™)**

APPLICATIONS

- **D-TV, HD-TV, STB, IP-STB, DVD-Player, DVD-Recorder, Printer**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Copyright © 2010, Texas Instruments Incorporated

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DESCRIPTION

The CDCE937 and CDCEL937 are modular PLL-based low-cost high-performance programmable clock synthesizers, multipliers, and dividers. It generates up to seven output clocks from a single input frequency. Each output can be programmed in-system for any clock frequency up to 230 MHz, using up to three independent configurable PLLs.

The CDCx937 has separate output supply pins, VDDOUT, which is 1.8 V for CDCEL937 and to 2.5 V to 3.3 V for CDCE937.

The input accepts an external crystal or LVCMOS clock signal. If an external crystal is used, an on-chip load capacitor is adequate for most applications. The value of the load capacitor is programmable from 0 to 20 pF. Additionally, an on-chip VCXO is selectable which allows synchronization of the output frequency to an external control signal, that is, PWM signal.

The deep M/N divider ratio allows the generation of zero ppm audio/video, networking (WLAN, BlueTooth, Ethernet, GPS) or Interface (USB, IEEE1394, Memory Stick) clocks from a reference input frequency such as 27 MHz.

All PLLs supports SSC (Spread-Spectrum Clocking). SSC can be Center-Spread or Down-Spread clocking which is a common technique to reduce electro-magnetic interference (EMI).

Based on the PLL frequency and the divider settings, the internal loop filter components are automatically adjusted to achieve high stability and optimized jitter transfer characteristic of each PLL.

The device supports non-volatile EEPROM programming for ease-customized application. It is preset to a factory default configuration (see the *Default Device Configuration* section). It can be reprogrammed to a different application configuration before PCB assembly, or reprogrammed by in-system programming. All device settings are programmable through SDA/SCL bus, a 2-wire serial interface.

Three programmable control inputs, S0, S1 and S2, can be used to control various aspects of operation including frequency selection changing the SSC parameters to lower EMI, PLL bypass, power down, and choosing between low level or 3-state for output-disable function.

The CDCEx937 operates in 1.8-V environment. It is characterized for operation from –40°C to 125°C.

ORDERING INFORMATION[1]

| T_A	PACKAGE[2]		ORDERABLE PART NUMBER	TOP-SIDE MARKING
–40°C to 125°C	TSSOP – PW	Reel of 2000	CDCE937QPWRQ1	CDCE937Q
			CDCEL937QPWRQ1	CEL937Q

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

Terminal Functions

NAME	PIN TSSOP24	TYPE	DESCRIPTION
Y1, Y2, ... Y7	17, 15, 14, 7, 8, 12, 11	O	LVCMOS outputs
Xin/CLK	1	I	Crystal oscillator input or LVCMOS clock input (selectable via SDA/SCL bus)
Xout	20	O	Crystal oscillator output (leave open or pull up (~500k) when not used)
V_{Ctrl}	4	I	VCXO control voltage (leave open or pull up (~500k) when not used)
V_{DD}	3	Power	1.8-V power supply for the device
Vddout	6, 10, 13	Power	**CDCEL937**: 1.8-V supply for all outputs
			CDCE937: 3.3-V or 2.5-V supply for all outputs
GND	5, 9, 16	Ground	Ground
S0	2	I	User-programmable control input S0; LVCMOS inputs; Internal pullup 500k
SDA/S1	19	I/O or I	**SDA:** Bidirectional serial data input/output (default configuration). LVCMOS; Internal pullup 500k; or **S1:** User-programmable control input; LVCMOS inputs; Internal pullup 500k
SCL/S2	18	I	**SCL:** Serial clock input(default configuration), LVCMOS; Internal pullup 500k; or **S2:** User-programmable control input; LVCMOS inputs; Internal pullup 500k

FUNCTIONAL BLOCK DIAGRAM
ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)[1]

		VALUE	UNIT
V_{DD}	Supply voltage range	−0.5 to 2.5	V
V_I	Input voltage range [2] [3]	−0.5 to V_{DD} + 0.5	V
V_O	Output voltage range [2]	−0.5 to Vddout + 0.5	V
I_I	Input current (V_I < 0, V_I > V_{DD})	20	mA
I_O	Continuous output current	50	mA
T_{stg}	Storage temperature range	−65 to 150	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output negative voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
(3) SDA and SCL can go up to 3.6 V as stated in the *Recommended Operating Conditions* table.

PACKAGE THERMAL RESISTANCE[1]

over operating free-air temperature range (unless otherwise noted)

PARAMETER		AIRFLOW (lfm)	°C/W
T_{JA}	Thermal resistance, junction to ambient	0	89
		150	75
		200	74
		250	74
		500	69
T_{JC}	Thermal resistance, junction to case	—	31
T_{JB}	Thermal resistance, junction to board	—	55
$R_{\theta JT}$	Thermal resistance, junction to top	—	0.8
$R_{\theta JB}$	Thermal resistance, junction to bottom	—	49

(1) The package thermal impedance is calculated in accordance with JESD 51 and JEDEC2S2P (high-k board).

RECOMMENDED OPERATING CONDITIONS

			MIN	NOM	MAX	UNIT
V_{DD}	Device supply voltage		1.7	1.8	1.9	V
V_O	Output Yx supply voltage, Vddout	CDCE937	2.3		3.6	V
		CDCEL937	1.7		1.9	
V_{IL}	Low-level input voltage LVCMOS				0.3 V_{DD}	V
V_{IH}	High-level input voltage LVCMOS		0.7 V_{DD}			V
$V_{I(thresh)}$	Input voltage threshold LVCMOS			0.5 V_{DD}		V
V_{IS}	Input voltage range S0		0		1.9	V
	Input voltage range S1, S2, SDA, SCL; $V_{I(thresh)}$ = 0.5 V_{DD}		0		3.6	
$V_{I(CLK)}$	Input voltage range CLK		0		1.9	V
I_{OH} / I_{OL}	Output current (Vddout = 3.3 V)				±12	mA
	Output current (Vddout = 2.5 V)				±10	
	Output current (Vddout = 1.8 V)				±8	
C_L	Output load LVCMOS				10	pF
T_A	Ambient temperature		−40		125	°C

Product Folder Link(s): *CDCE937-Q1*

RECOMMENDED CRYSTAL/VCXO SPECIFICATIONS[1]

		MIN	NOM	MAX	UNIT
f_{Xtal}	Crystal input frequency range (fundamental mode)	8	27	32	MHz
ESR	Effective series resistance			100	Ω
f_{PR}	Pulling range (0 V ≤ Vctrl ≤ 1.8 V)[2]	±120	±150		ppm
	Frequency control voltage, Vctrl	0		V_{DD}	V
C_0/C_1	Pullability ratio			220	
C_L	On-chip load capacitance at Xin and Xout	0		20	pF

(1) For more information about VCXO configuration, and crystal recommendation, see application report (SCAA085).
(2) Pulling range depends on crystal-type, on-chip crystal load capacitance and PCB stray capacitance; pulling range of min ±120 ppm applies for crystal listed in the application report (SCAA085).

EEPROM SPECIFICATION

		MIN	TYP	MAX	UNIT
EEcyc	Programming cycles of EEPROM	1000			cycles
EEret	Data retention	10			years

CLK_IN TIMING REQUIREMENTS

over recommended ranges of supply voltage, load, and operating ambient temperature

			MIN	NOM	MAX	UNIT
f_{CLK}	LVCMOS clock input frequency	PLL bypass mode	0		160	MHz
		PLL mode	8		160	
t_r / t_f	Rise and fall time CLK signal (20% to 80%)				3	ns
$duty_{CLK}$	Duty cycle CLK at V_{DD}/2		40%		60%	

SDA/SCL TIMING REQUIREMENTS

see Figure 12

		STANDARD MODE		FAST MODE		UNIT
		MIN	MAX	MIN	MAX	
f_{SCL}	SCL clock frequency	0	100	0	400	kHz
$t_{su(START)}$	START setup time (SCL high before SDA low)	4.7		0.6		µs
$t_{h(START)}$	START hold time (SCL low after SDA low)	4		0.6		µs
$t_{w(SCLL)}$	SCL low-pulse duration	4.7		1.3		µs
$t_{w(SCLH)}$	SCL high-pulse duration	4		0.6		µs
$t_{h(SDA)}$	SDA hold time (SDA valid after SCL low)	0	3.45	0	0.9	µs
$t_{su(SDA)}$	SDA setup time	250		100		ns
t_r	SCL/SDA input rise time		1000		300	ns
t_f	SCL/SDA input fall time		300		300	ns
$t_{su(STOP)}$	STOP setup time	4		0.6		µs
t_{BUS}	Bus free time between a STOP and START condition	4.7		1.3		µs

DEVICE CHARACTERISTICS

		Vddout = 1.8 V		230			
LVCMOS PARAMETER							
V_{IK}	LVCMOS input voltage	V_{DD} = 1.7 V; I_I = –18 mA				–1.2	V
I_I	LVCMOS Input current	VI = 0 V or V_{DD}; V_{DD} = 1.9 V				±5	µA
I_{IH}	LVCMOS Input current for S0/S1/S2	V_I = V_{DD}; V_{DD} = 1.9 V				5	µA
I_{IL}	LVCMOS Input current for S0/S1/S2	V_I = 0 V; V_{DD} = 1.9 V				–6	µA
C_I	Input capacitance at Xin/Clk	$V_{I(Clk)}$ = 0 V or V_{DD}			6		pF
	Input capacitance at Xout	$V_{I(Xout)}$ = 0 V or V_{DD}			2		
	Input capacitance at S0/S1/S2	V_{IS} = 0 V or V_{DD}			3		
LVCMOS PARAMETER FOR Vddout = 3.3 V (CDCE937)							
V_{OH}	LVCMOS high-level output voltage	Vddout = 3 V, I_{OH} = –0.1 mA		2.9			V
		Vddout = 3 V, I_{OH} = –8 mA		2.4			
		Vddout = 3 V, I_{OH} = –12 mA		2.2			
V_{OL}	LVCMOS low-level output voltage	Vddout = 3 V, I_{OL} = 0.1 mA				0.1	V
		Vddout = 3 V, I_{OL} = 8 mA				0.5	
		Vddout = 3 V, I_{OL} = 12 mA				0.8	
t_{PLH}, t_{PHL}	Propagation delay	All PLL bypass			3.2		ns
t_r/t_f	Rise and fall time	Vddout= 3.3 V (20%–80%)			0.6		ns
$t_{jit(cc)}$	Cycle-to-cycle jitter[2] [3]	1 PLL switching, Y2-to-Y3			60	90	ps
		3 PLL switching, Y2-to-Y7			100	150	
$t_{jit(per)}$	Peak-to-peak period jitter[3]	1 PLL switching, Y2-to-Y3			70	100	ps
		3 PLL switching, Y2-to-Y7			120	180	
$t_{sk(o)}$	Output skew [4] , See Table 2	f_{OUT} = 50 MHz; Y1-to-Y3				60	ps
		f_{OUT} = 50 MHz; Y2-to-Y5				160	
odc	Output duty cycle [5]	f_{VCO} = 100 MHz; Pdiv = 1		45%		55%	

(1) All typical values are at respective nominal V_{DD}.
(2) 10000 cycles.
(3) Jitter depends on configuration. Data is taken under the following conditions: 1-PLL : f_{IN} = 27MHz, Y2/3 = 27 MHz, (measured at Y2), 3-PLL: f_{IN} = 27 MHz, Y2/3 = 27 MHz (measured at Y2), Y4/5 = 16.384 MHz, Y6/7 = 74.25 MHz
(4) The tsk(o) specification is only valid for equal loading of each bank of outputs, and outputs are generated from the same divider; data taking on rising edge (tr).
(5) odc depends on output rise and fall time (t_r/t_f).

DEVICE CHARACTERISTICS (continued)

APPLICATION INFORMATION

CONTROL TERMINAL SETTING

The CDCE937/CDCEL937 has three user-definable control terminals (S0, S1, and S2) that allow external control of device settings. They can be programmed to any of the following setting:

- Spread spectrum clocking selection → spread type and spread amount selection
- Frequency selection → switching between any of two user-defined frequencies
- Output state selection → output configuration and power down control

The user can predefine up to eight different control settings. Table 1 and Table 2 explain these settings.

Table 1. Control Terminal Definition

External Control Bits	PLL1 Setting			PLL2 Setting			PLL3 Setting			Y1 Setting
Control Function	PLL Frequency Selection	SSC Selection	Output Y2/Y3 Selection	PLL Frequency Selection	SSC Selection	Output Y4/Y5 Selection	PLL Frequency Selection	SSC Selection	Output Y6/Y7 Selection	Output Y1 and Power-Down Selection

Table 2. PLLx Setting (can be selected for each PLL individual)[1]

SSC Selection (Center/Down)				
SSCx [3-bits]			Center	Down
0	0	0	0% (off)	0% (off)
0	0	1	±0.25%	−0.25%
0	1	0	±0.5%	−0.5%
0	1	1	±0.75%	−0.75%
1	0	0	±1.0%	−1.0%
1	0	1	±1.25%	−1.25%
1	1	0	±1.5%	−1.5%
1	1	1	±2.0%	−2.0%
FREQUENCY SELECTION[2]				
FSx		FUNCTION		
0		Frequency0		
1		Frequency1		
OUTPUT SELECTION[3] (Y2 ... Y7)				
YxYx		FUNCTION		
0		State0		
1		State1		

(1)   Center/Down-Spread, Frequency0/1 and State0/1 are user-definable in PLLx Configuration Register;
(2)   Frequency0 and Frequency1 can be any frequency within the specified f_{VCO} range.
(3)   State0/1 selection is valid for both outputs of the corresponding PLL module and can be power down, 3-state, low or active

Table 3. Y1 Setting[1]

Y1 SELECTION	
Y1	FUNCTION
0	State 0
1	State 1

(1)   State0 and State1 are user definable in Generic Configuration Register and can be power down, 3-state, low, or active.

Product Folder Link(s): *CDCE937-Q1*

S1/SDA and S2/SCL pins of the CDCE937/CDCEL937 are dual function pins. In default configuration they are defined as SDA/SCL for the serial interface. They can be programmed as control-pins (S1/S2) by setting the relevant bits in the EEPROM. Note that the changes to the Control register (Bit [6] of Byte [02]) have no effect until they are written into the EEPROM.

Once they are set as control pins, the serial programming interface is no longer available. However, if V_{DDOUT} is forced to GND, the two control-pins, S1 and S2, temporally act as serial programming pins (SDA/SCL).

S0 is not a multi-use pin, it is a control pin only.

DEFAULT DEVICE SETTING

The internal EEPROM of CDCE937/CDCEL937 is preconfigured as shown in Figure 6. (The input frequency is passed through to the output as a default). This allows the device to operate in default mode without the extra production step of program it. The default setting appears after power is supplied or after power-down/up sequence until it is re-programmed by the user to a different application configuration. A new register setting is programmed via the serial SDA/SCL Interface.
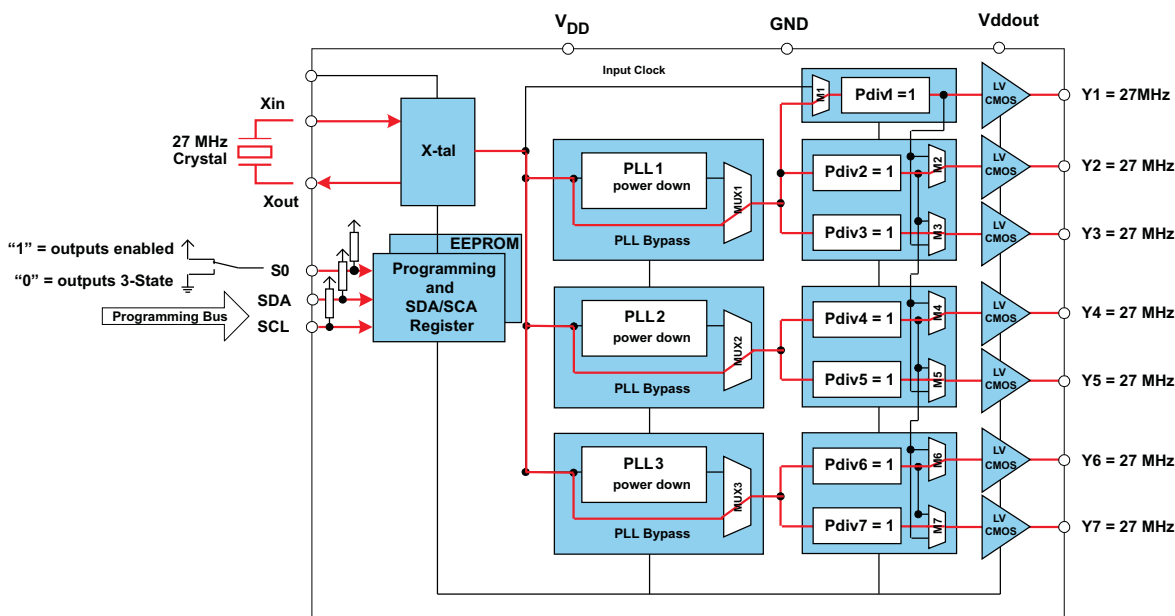

Figure 6. Default Device Setting

Table 4 shows the factory default setting for the Control Terminal Register (external control pins). In normal operation, all 8 register settings are available, but in the default configuration only the first two settings (0 and 1) can be selected with S0, as S1 and S2 configured as programming pins in default mode.

Table 4. Factory Default Setting for Control Terminal Register[1]

			Y1	PLL1 Settings			PLL2 Settings			PLL3 Settings		
External Control Pins			Output Selection	Frequency Selection	SSC Selection	Output Selection	Frequency Selection	SSC Selection	Output Selection	Frequency Selection	SSC Selection	Output Selection
S2	S1	S0	Y1	FS1	SSC1	Y2Y3	FS2	SSC2	Y4Y5	FS3	SSC3	Y6Y7
SCL (I2C)	SDA (I2C)	0	3-state	f_{VCO1_0}	off	3-state	f_{VCO2_0}	off	3-state	f_{VCO1_0}	off	3-state
SCL (I2C)	SDA (I2C)	1	enabled	f_{VCO1_0}	off	enabled	f_{VCO2_0}	off	enabled	f_{VCO1_0}	off	enabled

(1) In default mode or when programmed respectively, S1 and S2 act as serial programming interface, SDA/SCL. They do not have any control-pin function but they are internally interpreted as if S1=0 and S2=0. S0, however, is a control-pin which in the default mode switches all outputs ON or OFF (as previously predefined).

SDA/SCL SERIAL INTERFACE

The CDCE937/CDCEL937 operates as a slave device of the 2-wire serial SDA/SCL bus, compatible with the popular SMBus or I²C specification. It operates in the standard-mode transfer (up to 100kbit/s) and fast-mode transfer (up to 400kbit/s) and supports 7-bit addressing.

The S1/SDA and S2/SCL pins of the CDC9xx are dual function pins. In the default configuration they are used as SDA/SCL serial programming interface. They can be re-programmed as general purpose control pins, S1 and S2, by changing the corresponding EEPROM setting, Byte 02, Bit [6].

DATA PROTOCOL

The device supports *Byte Write and Byte Read* and *Block Write and Block Read* operations.

For *Byte Write/Read* operations, the system controller can individually access addressed bytes.

For *Block Write/Read* operations, the bytes are accessed in sequential order from lowest to highest byte (with most significant bit first) with the ability to stop after any complete byte has been transferred. The numbers of Bytes read-out are defined by Byte Count in the Generic Configuration Register. At Block Read instruction all bytes defined in the Byte Count has to be readout to correctly finish the read cycle.

Once a byte has been sent, it is written into the internal register and is effective immediately. This applies to each transferred byte independent of whether this is a *Byte Write* or a *Block Write* sequence.

If the EEPROM Write Cycle is initiated, the internal SDA register contents are written into the EEPROM. During this write cycle, data is not accepted at the SDA/SCL bus until the write cycle is completed. However, data can be read during the programming sequence (Byte Read or Block Read). The programming status can be monitored by reading *EEPIP*, Byte 01–Bit [6].

The offset of the indexed byte is encoded in the command code, as described in Table 5.

Table 5. Slave Receiver Address (7 Bits)

DEVICE	A6	A5	A4	A3	A2	A1[1]	A0[1]	R/$\overline{\text{W}}$
CDCE913/CDCEL913	1	1	0	0	1	0	1	1/0
CDCE925/CDCEL925	1	1	0	0	1	0	0	1/0
CDCE937/CDCEL937	**1**	**1**	**0**	**1**	**1**	**0**	**1**	**1/0**
CDCE949/CDCEL949	1	1	0	1	1	0	0	1/0

(1) Address bits A0 and A1 are programmable via the SDA/SCL bus (Byte 01, Bit [1:0]). This allows addressing up to 4 devices connected to the same SDA/SCL bus. The least-significant bit of the address byte designates a write or read operation.

COMMAND CODE DEFINITION

Table 6. Command Code Definition

| BIT	DESCRIPTION
7	0 = *Block Read* or *Block Write* operation 1 = *Byte Read* or *Byte Write* operation
(6:0)	Byte Offset for *Byte Read*, *Block Read*, *Byte Write* and *Block Write* operation.

Timing Diagram for the SDA/SCL Serial Control Interface
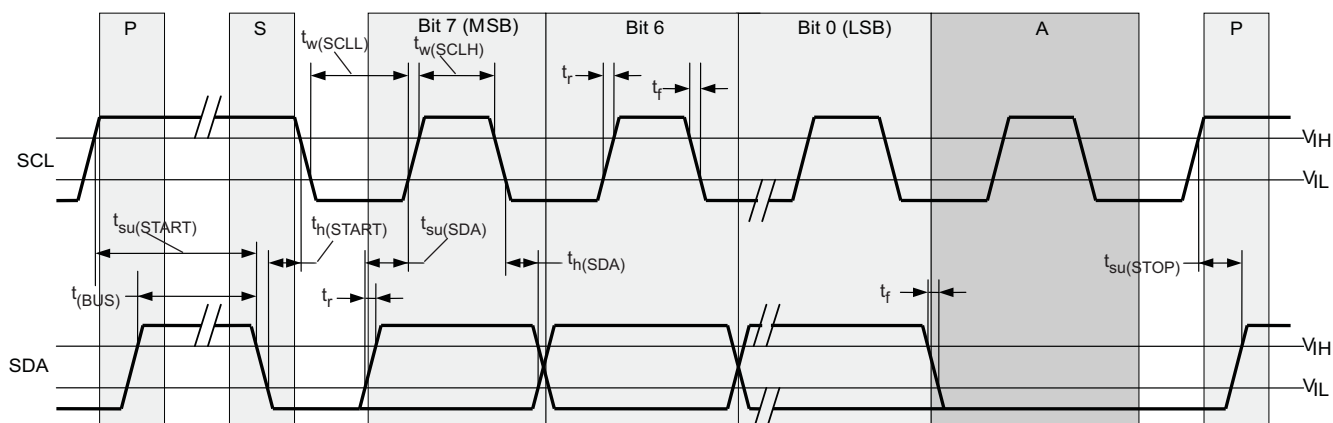

Figure 12. Timing Diagram for SDA/SCL Serial Control Interface

SDA/SCL HARDWARE INTERFACE

Figure 13 shows how the CDCE937/CDCEL937 clock synthesizer is connected to the SDA/SCL serial interface bus. Multiple devices can be connected to the bus but the speed may need to be reduced (400 kHz is the maximum) if many devices are connected.

Note that the pullup resistors (R_P) depends on the supply voltage, bus capacitance, and number of connected devices. The recommended pullup value is 4.7 kΩ. It must meet the minimum sink current of 3 mA at V_{OLmax} = 0.4 V for the output stages (for more details see SMBus or I^{2}C Bus specification).
Figure 13. SDA / SCL Hardware Interface

SDA/SCL CONFIGURATION REGISTERS

The clock input, control pins, PLLs, and output stages are user configurable. The following tables and explanations describe the programmable functions of the CDCE937/CDCEL937. All settings can be manually written into the device via the SDA/SCL bus or easily programmed by using the TI Pro-Clock™ software. TI Pro-Clock™ software allows the user to quickly make all settings and automatically calculates the values for optimized performance at lowest jitter.

Table 7. SDA/SCL Registers

Address Offset	Register Description	Table
00h	Generic Configuration Register	Table 9
10h	PLL1 Configuration Register	Table 10
20h	PLL2 Configuration Register	Table 11
30h	PLL3 Configuration Register	Table 12

The grey-highlighted bits, described in the Configuration Registers tables in the following pages, belong to the Control Terminal Register. The user can predefine up to eight different control settings. These settings then can be selected by the external control pins, S0, S1, and S2 (see the *Control Terminal Configuration* section).

(1) Address Offset refers to the byte address in the Configuration Register in the following pages.

Table 9. Generic Configuration Register

Offset[1]	Bit[2]	Acronym	Default[3]	Description
00h	7	E_EL	Xb	Device identification (read-only): 1 is CDCE937 (3.3 V), 0 is CDCEL937 (1.8 V)
	6:4	RID	Xb	Revision Identification Number (read only)
	3:0	VID	1h	Vendor Identification Number (read only)
01h	7	–	0b	Reserved – always write 0
	6	EEPIP	0b	EEPROM Programming Status: [4] (read only) 0 – EEPROM programming is completed / 1 – EEPROM is in programming mode
	5	EELOCK	0b	Permanently Lock EEPROM Data[5] 0 – EEPROM is not locked / 1 – EEPROM will be permanently locked
	4	PWDN	0b	Device Power Down (overwrites S0/S1/S2 setting; configuration register settings are unchanged) Note: PWDN cannot be set to 1 in the EEPROM. 0 – device active (PLL1 and all outputs are enabled) / 1 – device power down (PLL1 in power down and all outputs in 3-state)
	3:2	INCLK	00b	Input clock selection: 00 – Xtal 01 – VCXO 10 – LVCMOS 11 – reserved
	1:0	SLAVE_ADR	01b	Programmable Address Bits A0 and A1 of the Slave Receiver Address
02h	7	M1	1b	Clock source selection for output Y1: 0 – input clock 1 – PLL1 clock
	6	SPICON	0b	Operation mode selection for pin 18/19[6] 0 – serial programming interface SDA (pin 19) and SCL (pin 18) / 1 – control pins S1 (pin 19) and S2 (pin 18)
	5:4	Y1_ST1	11b	Y1-State0/1 Definition
	3:2	Y1_ST0	01b	00 – device power down (all PLLs in power down and all outputs in 3-State) 10 – Y1 disabled to low / 01 – Y1 disabled to 3-state 11 – Y1 enabled
	1:0	Pdiv1 [9:8]	001h	10-Bit Y1-Output-Divider Pdiv1: 0 – divider reset and stand-by
03h	7:0	Pdiv1 [7:0]		1-to-1023 – divider value
04h	7	Y1_7	0b	Y1_ST0/Y1_ST1 State Selection[7]
	6	Y1_6	0b	0 – State0 (predefined by Y1_ST0)
	5	Y1_5	0b	1 – State1 (predefined by Y1_ST1)
	4	Y1_4	0b	
	3	Y1_3	0b	
	2	Y1_2	0b	
	1	Y1_1	1b	
	0	Y1_0	0b	
05h	7:3	XCSEL	0Ah	Crystal Load Capacitor Selection[8] 00h → 0 pF / 01h → 1 pF / 02h → 2 pF / : / 14h-to-1Fh → 20 pF
	2:0		0b	Reserved – do not write other than 0
06h	7:1	BCOUNT	40h	7-Bit Byte Count (defines the number of bytes which will be sent from this device at the next Block Read transfer); all bytes have to be read out to correctly finish the read cycle.)
	0	EEWRITE	0b	Initiate EEPROM Write Cycle[4] [9] 0– no EEPROM write cycle / 1 – start EEPROM write cycle (internal configuration register is saved to the EEPROM)
(1) Writing data beyond '40h' may affect device function.
(2) All data transferred with the MSB first.
(3) Unless customer-specific setting.
(4) During EEPROM programming, no data is allowed to be sent to the device via the SDA/SCL bus until the programming sequence is completed. Data, however, can be read out during the programming sequence (Byte Read or Block Read).
(5) If this bit is set to high in the EEPROM, the actual data in the EEPROM will be permanently locked. There is no further programming possible. Data, however can still be written via SDA/SCL bus to the internal register to change device function on the fly. But new data can no longer be saved to the EEPROM. EELOCK is effective only, if written into the EEPROM.
(6) Selection of "control pins" is effective only if written into the EEPROM. Once written into the EEPROM, the serial programming pins are no longer available. However, if V_{DDOUT} is forced to GND, the two control pins, S1 and S2, temporally act as serial programming pins (SDA/SCL), and the two slave receiver address bits are reset to A0="0" and A1="0".
(7) These are the bits of the Control Terminal Register. The user can predefine up to eight different control settings. These settings then can be selected by the external control pins, S0, S1, and S2.
(8) The internal load capacitor (C1, C2) has to be used to achieve the best clock performance. External capacitors should be used only to finely adjust C_L by a few pF's. The value of C_L can be programmed with a resolution of 1 pF for a crystal load range of 0 pF to 20 pF. For C_L > 20 pF, use additional external capacitors. Also, the value of the device input capacitance has to be considered which always adds 1.5 pF (6 pF//2 pF) to the selected C_L. For more information about VCXO configuration and crystal recommendation, see application report SCAA085.
(9) Note: The EEPROM WRITE bit must be sent last. This ensures that the content of all internal registers are stored in the EEPROM. The EEWRITE cycle is initiated with the rising edge of the EEWRITE bit. A static level high does not trigger an EEPROM WRITE cycle. The EEWRITE bit has to be reset to low after the programming is completed. The programming status can be monitored by reading out EEPIP. If EELOCK is set to high, no EEPROM programming is possible.

(1) Writing data beyond 40h may affect device function.
(2) All data is transferred MSB-first.
(3) Unless a custom setting is used
(4) These are the bits of the *Control Terminal Register*. The user can pre-define up to eight different control settings. At normal device operation, these setting can be selected by the external control pins, S0, S1, and S2.

Table 12. PLL3 Configuration Register (continued)

OFFSET[1]	Bit[2]	Acronym	Default[3]	DESCRIPTION
36h	7	SSC3DC	0b	PLL3 SSC down/center selection: 0 – down 1 – center
	6:0	Pdiv6	01h	7-Bit Y6-Output-Divider Pdiv6: 0 – reset and stand-by 1-to-127 – divider value
37h	7	—	0b	Reserved – do not write others than 0
	6:0	Pdiv7	01h	7-Bit Y7-Output-Divider Pdiv7: 0 – reset and stand-by 1-to-127 – divider value
38h	7:0	PLL3_0N [11:4]	004h	PLL3_0: 30-Bit Multiplier/Divider value for frequency f_{VCO3_0} (for more information see paragraph *PLL Multiplier/Divider Definition*)
39h	7:4	PLL3_0N [3:0]		
	3:0	PLL3_0R [8:5]	000h	
3Ah	7:3	PLL3_0R[4:0]		
	2:0	PLL3_0Q [5:3]	10h	
3Bh	7:5	PLL3_0Q [2:0]		
	4:2	PLL3_0P [2:0]	010b	
	1:0	VCO3_0_RANGE	00b	f_{VCO3_0} range selection: 00 – f_{VCO3_0} < 125 MHz 01 – 125 MHz ≤ f_{VCO3_0} < 150 MHz 10 – 150 MHz ≤ f_{VCO3_0} < 175 MHz 11 – f_{VCO3_0} ≥ 175 MHz
3Ch	7:0	PLL3_1N [11:4]	004h	PLL3_1: 30-Bit Multiplier/Divider value for frequency f_{VCO3_1} (for more information see paragraph *PLL Multiplier/Divider Definition*)
3Dh	7:4	PLL3_1N [3:0]		
	3:0	PLL3_1R [8:5]	000h	
3Eh	7:3	PLL3_1R[4:0]		
	2:0	PLL3_1Q [5:3]	10h	
3Fh	7:5	PLL3_1Q [2:0]		
	4:2	PLL3_1P [2:0]	010b	
	1:0	VCO3_1_RANGE	00b	f_{VCO3_1} range selection: 00 – f_{VCO3_1} < 125 MHz 01 – 125 MHz ≤ f_{VCO3_1} < 150 MHz 10 – 150 MHz ≤ f_{VCO3_1} < 175 MHz 11 – f_{VCO3_1} ≥ 175 MHz

PLL Multiplier/Divider Definition

At a given input frequency (f_{IN}), the output frequency (f_{OUT}) of the CDCE937/CDCEL937 can be calculated:

$$f_{OUT} = \frac{f_{IN}}{Pdiv} \times \frac{N}{M}$$

(1)

where

    M (1 to 511) and N (1 to 4095) are the multiplier/divide values of the PLL;
    Pdiv (1 to 127) is the output divider.

The target VCO frequency (f_{VCO}) of each PLL can be calculated:

$$f_{VCO} = f_{IN} \times \frac{N}{M}$$

(2)

The PLL internally operates as fractional divider and needs the following multiplier/divider settings:

    N

$$P = 4 - int\left(\log_2 \frac{N}{M}\right) \text{ [if P} < 0 \text{ then P} = 0]$$

$$Q = int\left(\frac{N'}{M}\right)$$

$$R = N' - M \times Q$$

where

    $N' = N \times 2^P$
    $N \geq M$
    100 MHz < f_{VCO} > 200 MHz

Example:

for f_{IN} = 27 MHz; M = 1; N = 4; Pdiv = 2;

    → f_{OUT} = 54 MHz
    → f_{VCO} = 108 MHz
    → P = 4 – int($\log_2$4) = 4 – 2 = 2
    → N' = 4 × 2^2 = 16
    → Q = int(16) = 16
    → R = 16 – 16 = 0

for f_{IN} = 27 MHz; M = 2; N = 11; Pdiv = 2;

    → f_{OUT} = 74.25 MHz
    → f_{VCO} = 148.50 MHz
    → P = 4 – int($\log_2$5.5) = 4 – 2 = 2
    → N' = 11 × 2^2 = 44
    → Q = int(22) = 22
    → R = 44 – 44 = 0

The values for P, Q, R, and N' is automatically calculated when using TI Pro-Clock™ software.

PACKAGING INFORMATION

Orderable Device	Status [1]	Package Type	Package Drawing	Pins	Package Qty	Eco Plan [2]	Lead/Ball Finish	MSL Peak Temp [3]
CDCE937QPWRQ1	ACTIVE	TSSOP	PW	20	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
CDCEL937QPWRQ1	ACTIVE	TSSOP	PW	20	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check
http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
