DESCRIPTION/ORDERING INFORMATION

The TS3V712EL is a high bandwidth, 7-channel video demultiplexer for switching between a single VGA source and one of two end points. The device is designed for ensuring video signal integrity and minimizing video signal attenuation by providing high bandwidth of 1.3 GHz.

The TS3V712EL has integrated level shifting buffers for the H_{SYNC} and V_{SYNC} signals which provide voltage level translation between 3.3 V and 5 V logic. The SCL and SDA lines use NMOS switches which clamp the output voltage to 1 V below V_{DD} .

The video signals are protected against ESD with integrated diodes to V_{DD} and GND that support levels up to ±2-kV Contact Discharge (IEC61000-4-2) and 7-kV Human Body Model (JESD22-A114E).

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.
