EV2112DQ-00A

1A, 1MHz Synchronous
Step-Down Converter

EVALUATION BOARD

DESCRIPTION

The EV2111/12DQ-00A is an evaluation board for the MP2112DQ.

The MP2112 is a 1MHz constant frequency, current mode, PWM step-down converter. The device integrates a main switch and a synchronous rectifier for high efficiency without an external Schottky diode. It is ideal for powering portable equipment that runs from a single cell Lithium-Ion (Li+) battery. The MP2112 can supply 1A of load current from a 2.5V to 6V input voltage. The output voltage can be regulated as low as 0.6V. The MP2112 can also run at 100% duty cycle for low dropout applications.

The MP2112 is available in a space-saving 6-pin 3mmx3mm QFN package with an exposed pad.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	2.5 – 6	V
Output Voltage	V_{OUT}	1.8	V
Output Current	I_{OUT}	1	A

FEATURES

- High Efficiency: Up to 95%
- 1A Available Load Current
- 2.5V to 6V Input Voltage Range

APPLICATIONS

- Cellular and Smart Phones
- Microprocessors and DSP Core Supplies
- PDAs
- MP3 Players
- Set-top Box
- Digital Still and Video Cameras
- Portable Instruments

"MPS" and "The Future of Analog IC Technology", are Trademarks of Monolithic Power Systems, Inc.

QUICK START GUIDE

The output voltage of this board is set to 1.8V, and the board accommodates most commonly used inductors and capacitors.

1. Attach the positive and negative ends of the load to the VOUT and GND pins, respectively.
2. Attach the input voltage ($2.5V \leq V_{IN} \leq 6V$) and input ground to the VIN and GND pins, respectively. The IC should automatically startup.

To operate the IC through the enable pin without automatic startup, first remove resistor R3.

Apply a voltage greater than 1.5V to enable the IC; lower than 0.3V to shut it off. Be careful not to exceed 6V on the EN pin.

3. The output voltage of this board can be changed by varying the value of resistor R2. Calculate the value of R2 using the equation:

$$R2 = \frac{R1}{\frac{V_{OUT}}{V_{FB}} - 1}$$

Where $V_{FB}=0.6V$ and $R1=499k\Omega$.

For example, if $V_{OUT}=2.5V$ is desired:

$$R2 = \frac{499k}{\frac{2.5V}{0.6V} - 1} = 158k$$

Therefore, use a 158k Ω (1%) resistor for R2.
