

# 1.3GHz Low Noise, Low Distortion Differential ADC Driver for 140MHz IF

## FEATURES

- 1.3GHz –3dB Bandwidth
- Fixed Gain of 10V/V (20dB)
- –93dBc IMD<sub>3</sub> at 70MHz (Equivalent OIP<sub>3</sub> = 50.5dBm)
- –74dBc IMD<sub>3</sub> at 140MHz (Equivalent OIP<sub>3</sub> = 41dBm)
- 1nV/√Hz Internal Op Amp Noise
- 2.1nV/√Hz Total Input Noise
- 6.2dB Noise Figure
- Differential Inputs and Outputs
- 200Ω Input Impedance
- 2.85V to 3.5V Supply Voltage
- 50mA Supply Current (150mW)
- 1V to 1.6V Output Common Mode Voltage, Adjustable
- DC- or AC-Coupled Operation
- Max Differential Output Swing 4.4V<sub>P-P</sub>
- Small 16-Lead 3mm × 3mm × 0.75mm QFN Package

## APPLICATIONS

- Differential ADC Driver
- Differential Driver/Receiver
- Single Ended to Differential Conversion
- IF Sampling Receivers
- SAW Filter Interfacing

## DESCRIPTION

The LTC®6401-20 is a high-speed differential amplifier targeted at processing signals from DC to 140MHz. The part has been specifically designed to drive 12-, 14- and 16-bit ADCs with low noise and low distortion, but can also be used as a general-purpose broadband gain block.

The LTC6401-20 is easy to use, with minimal support circuitry required. The output common mode voltage is set using an external pin, independent of the inputs, which eliminates the need for transformers or AC-coupling capacitors in many applications. The gain is internally fixed at 20dB (10V/V).

The LTC6401-20 saves space and power compared to alternative solutions using IF gain blocks and transformers. The LTC6401-20 is packaged in a compact 16-lead 3mm × 3mm QFN package and operates over the –40°C to 85°C temperature range.

LT, LTC and LTM are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## LTC6400 AND LTC6401 SELECTOR GUIDE

Please check each datasheet for complete details.

PART NUMBER	GAIN (dB)	GAIN (V/V)	$Z_{IN}$ (DIFFERENTIAL) ( $\Omega$ )	$I_{CC}$ (mA)
LTC6400-20	20	10	200	90
LTC6401-20	20	10	200	50

In addition to the LTC6401 family of amplifiers, a lower distortion LTC6400 family is available. The LTC6400 is pin compatible to the LTC6401, and has the same low noise performance. The low distortion of the LTC6400 comes at the expense of higher power consumption. Please refer to the separate LTC6400 data sheets for complete details. Other gain versions from 8dB to 26dB will follow.

e <sub>IN,140M</sub>	Input Referred Voltage Noise Density	Includes Resistors (Short Inputs)		2.1		nV/ $\sqrt{\text{Hz}}$
e <sub>ON,140M</sub>	Output Referred Voltage Noise Density	Includes Resistors (Short Inputs)		22		nV/ $\sqrt{\text{Hz}}$
IMD <sub>3,130M/150M</sub>	Third-Order Intermodulation ( $f_1 = 130\text{MHz}$ $f_2 = 150\text{MHz}$ ) Measure at 170MHz	2V <sub>P-P,OUT</sub> Composite, $R_L = 375\Omega$ (Note 5)	-61	-69		dBc

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** Input pins ( $+IN$ ,  $-IN$ ) are protected by steering diodes to either supply. If the inputs go beyond either supply rail, the input current should be limited to less than 10mA.

**Note 3:** The LTC6401C and LTC6401I are guaranteed functional over the operating temperature range of  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ .

**Note 4:** The LTC6401C is guaranteed to meet specified performance from  $0^\circ\text{C}$  to  $70^\circ\text{C}$ . It is designed, characterized and expected to meet specified performance from  $-40^\circ\text{C}$  to  $85^\circ\text{C}$  but is not tested or QA sampled at these

temperatures. The LTC6401I is guaranteed to meet specified performance from  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ .

**Note 5:** Input and output baluns used. See Test Circuit A.

**Note 6:** Measured using Test Circuit B.

**Note 7:** Since the LTC6401-20 is a feedback amplifier with low output impedance, a resistive load is not required when driving an AD converter. Therefore, typical output power is very small. In order to compare the LTC6401-20 with amplifiers that require  $50\Omega$  output load, the LTC6401-20 output voltage swing driving a given  $R_L$  is converted to OIP<sub>3</sub> and P<sub>1dB</sub> as if it were driving a  $50\Omega$  load. Using this modified convention, 2V<sub>P-P</sub> is by definition equal to 10dBm, regardless of the actual  $R_L$ .

## PIN FUNCTIONS

**V<sup>+</sup> (Pins 1, 3, 10):** Positive Power Supply (Normally tied to 3V or 3.3V). All three pins must be tied to the same voltage. Bypass each pin with 1000pF and 0.1μF capacitors as close to the pins as possible.

**V<sub>OCM</sub> (Pin 2):** This pin sets the output common mode voltage. A 0.1μF external bypass capacitor is recommended.

**V<sup>-</sup> (Pins 4, 9, 12, 17):** Negative Power Supply. All four pins must be connected to the same voltage/ground.

**-OUT, +OUT (Pins 5, 8):** Unfiltered Outputs. These pins have 12.5Ω series resistors.

**-OUTF, +OUTF (Pins 6, 7):** Filtered Outputs. These pins have 50Ω series resistors and a 1.7pF shunt capacitance.

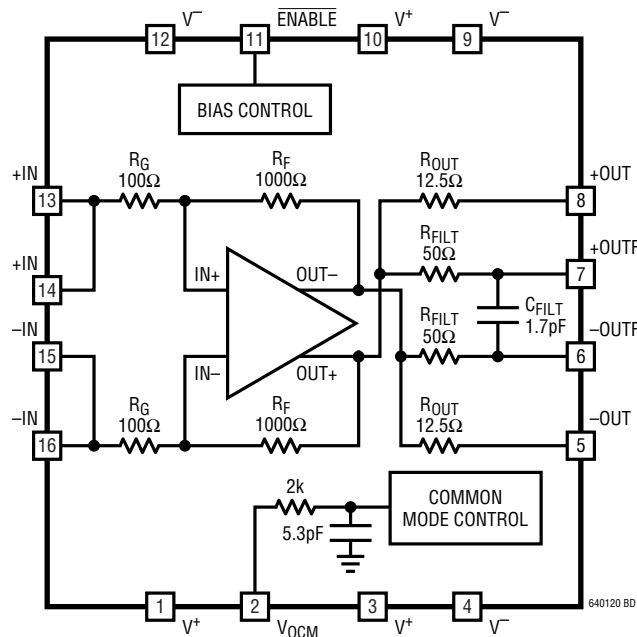

**ENABLE (Pin 11):** This pin is a logic input referenced to V<sup>-</sup>. If low, the part is enabled. If high, the part is disabled and draws approximately 1mA supply current.

**+IN (Pins 13, 14):** Positive Input. Pins 13 and 14 are internally shorted together.

**-IN (Pins 15, 16):** Negative Input. Pins 15 and 16 are internally shorted together.

**Exposed Pad (Pin 17):** V<sup>-</sup>. The Exposed Pad must be connected to the same voltage/ground as pins 4, 9, 12.

## BLOCK DIAGRAM

## APPLICATIONS INFORMATION

### Circuit Operation

The LTC6401-20 is a low noise and low distortion fully differential op amp/ADC driver with:

- Operation from DC to 1.3GHz –3dB bandwidth impedance
- Fixed gain of 10V/V (20dB)
- Differential input impedance 200Ω
- Differential output impedance 25Ω
- Differential impedance of output filter 100Ω

The LTC6401-20 is composed of a fully differential amplifier with on chip feedback and output common mode voltage control circuitry. Differential gain and input impedance are set by 100Ω/1000Ω resistors in the feedback network. Small output resistors of 12.5Ω improve the circuit stability over various load conditions. They also provide a possible external filtering option, which is often desirable when the load is an ADC.

Filter resistors of 50Ω are available for additional filtering. Lowpass/bandpass filters are easily implemented with just a couple of external components. Moreover, they offer single-ended 50Ω matching in wideband applications and no external resistor is needed.

The LTC6401-20 is very flexible in terms of I/O coupling. It can be AC- or DC-coupled at the inputs, the outputs or both. Due to the internal connection between input and output, users are advised to keep input common mode voltage between 1V and 1.6V for proper operation. If the inputs are AC-coupled, the input common mode voltage is automatically biased close to  $V_{OCM}$  and thus no external circuitry is needed for bias. The LTC6401-20 provides an output common mode voltage set by  $V_{OCM}$ , which allows driving an ADC directly without external components such as a transformer or AC coupling capacitors. The input signal can be either single-ended or differential with only minor differences in distortion performance.

### Input Impedance and Matching

The differential input impedance of the LTC6401-20 is 200Ω. If a 200Ω source impedance is unavailable, then

the differential inputs may need to be terminated to a lower value impedance, e.g. 50Ω, in order to provide an impedance match to the source. Several choices are available. One approach is to use a differential shunt resistor (Figure 1). Another approach is to employ a wideband transformer (Figure 2). Both methods provide a wideband match. The termination resistor or the transformer must be placed close to the input pins in order to minimize the reflection due to input mismatch. Alternatively, one could apply a narrowband impedance match at the inputs of the LTC6401-20 for frequency selection and/or noise reduction.

Referring to Figure 3, LTC6401-20 can be easily configured for single-ended input and differential output without a balun. The signal is fed to one of the inputs through a matching network while the other input is connected to the same matching network and a source resistor. Because the return ratios of the two feedback paths are equal, the

Figure 1. Input Termination for Differential 50Ω Input Impedance Using Shunt Resistor

Figure 2. Input Termination for Differential 50Ω Input Impedance Using a 1:4 Balun

## APPLICATIONS INFORMATION

**Figure 3. Input Termination for Single-Ended 50Ω Input Impedance**

two outputs have the same gain and thus symmetrical swing. In general, the single-ended input impedance and termination resistor  $R_T$  are determined by the combination of  $R_S$ ,  $R_G$  and  $R_F$ . For example, when  $R_S$  is 50Ω, it is found that the single-ended input impedance is 200Ω and  $R_T$  is 66.5Ω in order to match to a 50Ω source impedance.

The LTC6401-20 is unconditionally stable. However, the overall differential gain is affected by both source impedance and load impedance as shown in Figure 4:

$$A_V = \left| \frac{V_{OUT}}{V_{IN}} \right| = \frac{2000}{R_S + 200} \cdot \frac{R_L}{25 + R_L}$$

The noise performance of the LTC6401-20 also depends upon the source impedance and termination. For example, an input 1:4 balun transformer in Figure 2 improves SNR by adding 6dB of gain at the inputs. A trade-off between gain and noise is obvious when constant noise figure circle and constant gain circle are plotted within the same

**Figure 4. Calculate Differential Gain**

input Smith Chart, based on which users can choose the optimal source impedance for a given gain and noise requirement.

### Output Match and Filter

The LTC6401-20 can drive an ADC directly without external output impedance matching. Alternatively, the differential output impedance of 25Ω can be matched to higher value impedance, e.g. 50Ω, by series resistors or an LC network.

The internal low pass filter outputs at +OUTF/-OUTF have a -3dB bandwidth of 590MHz. External capacitor can reduce the low pass filter bandwidth as shown in Figure 5. A bandpass filter is easily implemented with only a few components as shown in Figure 6. Three 39pF capacitors and a 16nH inductor create a bandpass filter with 165MHz center frequency, -3dB frequencies at 138MHz and 200MHz.

**Figure 5. LTC6401-20 Internal Filter Topology Modified for Low Filter Bandwidth (Three External Capacitors)**

**Figure 6. LTC6401-20 Application Circuit for Bandpass Filtering (Three External Capacitors, One External Inductor)**

## APPLICATIONS INFORMATION

### Output Common Mode Adjustment

The LTC6401-20's output common mode voltage is set by the  $V_{OCM}$  pin, which is a high impedance input. The output common mode voltage is capable of tracking  $V_{OCM}$  in a range from 1V to 1.6V. Bandwidth of  $V_{OCM}$  control is typically 15MHz, which is dominated by a low pass filter connected to the  $V_{OCM}$  pin and is aimed to reduce common mode noise generation at the outputs. The internal common mode feedback loop has a  $-3\text{dB}$  bandwidth around 300MHz, allowing fast common mode rejection at the outputs of the LTC6401-20. The  $V_{OCM}$  pin should be tied to a DC bias voltage where a  $0.1\mu\text{F}$  bypass capacitor is recommended. When interfacing with A/D converters such as the LT22xx families, the  $V_{OCM}$  can be normally connected to the  $V_{CM}$  pin of the ADC.

### Driving A/D Converters

The LTC6401-20 has been specifically designed to interface directly with high speed A/D converters. In Figure 7, an example schematic shows the LTC6401-20 with a single-ended input driving the LTC2208, which is a 16-bit, 130Msps ADC. Two external  $10\Omega$  resistors help eliminate potential resonance associated with stray capacitance of PCB traces and bond wire inductance of either the ADC input or the driver output.  $V_{OCM}$  of the LTC6401-20 is connected to  $V_{CM}$  of the LTC2208 at 1.25V. Alternatively, a single-ended input signal can be converted to differential signal via a balun and fed to the input of the LTC6401-20. The balun also converts input impedance to match  $50\Omega$  source impedance.

Figure 7. Single-Ended Input to LTC6401-20 and LTC2208

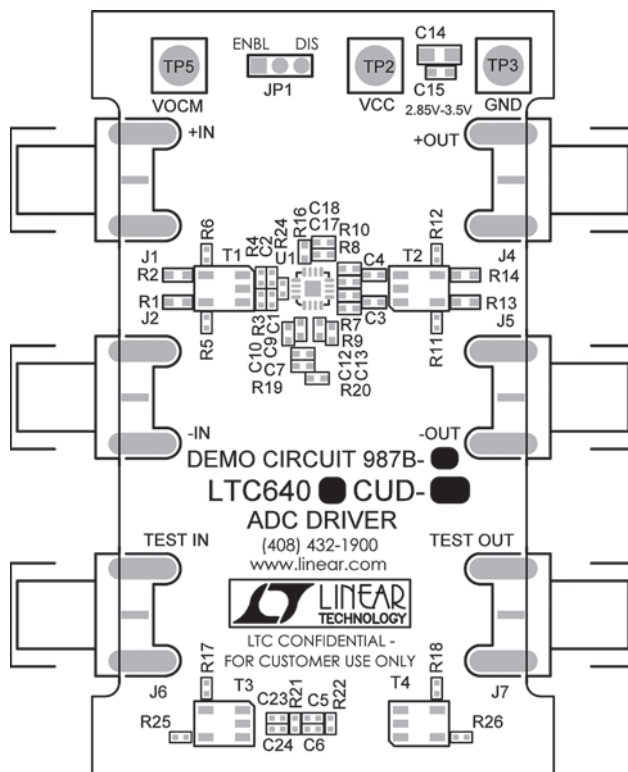

### Test Circuits

Due to the fully-differential design of the LTC6401 and its usefulness in applications with differing characteristic specifications, two test circuits are used to generate the information in this datasheet. Test Circuit A is DC987B, a two-port demonstration circuit for the LTC6401 family. The schematic and silkscreen are shown below. This circuit includes input and output transformers (baluns) for single-ended-to-differential conversion and impedance transformation, allowing direct hook-up to a 2-port network analyzer. There are also series resistors at the output to present the LTC6401 with a  $375\Omega$  differential load, optimizing distortion performance. Due to the input and output transformers, the  $-3\text{dB}$  bandwidth is reduced from 1.3GHz to approximately 1.1GHz.

Test Circuit B uses a 4-port network analyzer to measure S-parameters and gain/phase response. This removes the effects of the wideband baluns and associated circuitry, for a true picture of the  $>1\text{GHz}$  S-parameters and AC characteristics.

LT1993-2	800MHz Differential Amplifier/ADC Driver	$A_V = 2V/V$ , OIP3 = 38dBm at 70MHz
LT1993-4	900MHz Differential Amplifier/ADC Driver	$A_V = 4V/V$ , OIP3 = 40dBm at 70MHz
LT1993-10	700MHz Differential Amplifier/ADC Driver	$A_V = 10V/V$ , OIP3 = 40dBm at 70MHz
LT1994	Low Noise, Low Distortion Differential Op Amp	16-Bit SNR and SFDR at 1MHz, Rail-to-Rail Outputs
LT5514	Ultralow Distortion IF Amplifier/ADC Driver with Digitally Controlled Gain	OIP3 = 47dBm at 100MHz, Gain Control Range 10.5dB to 33dB
LT5524	Low Distortion IF Amplifier/ADC Driver with Digitally Controlled Gain	OIP3 = 40dBm at 100MHz, Gain Control Range 4.5dB to 37dB
LTC6400-20	1.8GHz Low Noise, Low Distortion, Differential ADC Driver	$A_V = 20dB$ , 90mA Supply Current, $IMD_3 = -65dBc$ at 300MHz
LT6402-6	300MHz Differential Amplifier/ADC Driver	$A_V = 6dB$ , Distortion < -80dBc at 25MHz
LT6402-12	300MHz Differential Amplifier/ADC Driver	$A_V = 12dB$ , Distortion < -80dBc at 25MHz
LT6402-20	300MHz Differential Amplifier/ADC Driver	$A_V = 20dB$ , Distortion < -80dBc at 25MHz
LTC6406	3GHz Rail-to-Rail Input Differential Op Amp	1.6nV/ $\sqrt{Hz}$ Noise, -72dBc Distortion at 50MHz, 18mA
LT6411	Low Power Differential ADC Driver/Dual Selectable Gain Amplifier	16mA Supply Current, $IMD_3 = -83dBc$ at 70MHz, $A_V = 1, -1$ or 2
<b>High-Speed Single-Ended Output Op Amps</b>		
LT1812/LT1813/ LT1814	High Slew Rate Low Cost Single/Dual/Quad Op Amps	8nV/ $\sqrt{Hz}$ Noise, 750V/ $\mu s$ , 3mA Supply Current
LT1815/LT1816/ LT1817	Very High Slew Rate Low Cost Single/Dual/Quad Op Amps	6nV/ $\sqrt{Hz}$ Noise, 1500V/ $\mu s$ , 6.5mA Supply Current
LT1818/LT1819	Ultra High Slew Rate Low Cost Single/Dual Op Amps	6nV/ $\sqrt{Hz}$ Noise, 2500V/ $\mu s$ , 9mA Supply Current
LT6200/LT6201	Rail-to-Rail Input and Output Low Noise Single/Dual Op Amps	0.95nV/ $\sqrt{Hz}$ Noise, 165MHz GBW, Distortion = -80dBc at 1MHz
LT6202/LT6203/ LT6204	Rail-to-Rail Input and Output Low Noise Single/Dual/Quad Op Amps	1.9nV/ $\sqrt{Hz}$ Noise, 3mA Supply Current, 100MHz GBW
LT6230/LT6231/ LT6232	Rail-to-Rail Output Low Noise Single/Dual/Quad Op Amps	1.1nV/ $\sqrt{Hz}$ Noise, 3.5mA Supply Current, 215MHz GBW
LT6233/LT6234/ LT6235	Rail-to-Rail Output Low Noise Single/Dual/Quad Op Amps	1.9nV/ $\sqrt{Hz}$ Noise, 1.2mA Supply Current, 60MHz GBW
<b>Integrated Filters</b>		
LTC1562-2	Very Low Noise, 8th Order Filter Building Block	Lowpass and Bandpass Filters up to 300kHz
LT1568	Very Low Noise, 4th Order Filter Building Block	Lowpass and Bandpass Filters up to 10MHz
LTC1569-7	Linear Phase, Tunable 10th Order Lowpass Filter	Single-Resistor Programmable Cut-Off to 300kHz
LT6600-2.5	Very Low Noise Differential 2.5MHz Lowpass Filter	SNR = 86dB at 3V Supply, 4th Order Filter
LT6600-5	Very Low Noise Differential 5MHz Lowpass Filter	SNR = 82dB at 3V Supply, 4th Order Filter
LT6600-10	Very Low Noise Differential 10MHz Lowpass Filter	SNR = 82dB at 3V Supply, 4th Order Filter
LT6600-15	Very Low Noise Differential 15MHz Lowpass Filter	SNR = 76dB at 3V Supply, 4th Order Filter
LT6600-20	Very Low Noise Differential 20MHz Lowpass Filter	SNR = 76dB at 3V Supply, 4th Order Filter
