DESCRIPTION

The Si9243AEY is a monolithic bus transceiver designed to provide bidirectional serial communication in automotive diagnostic applications.

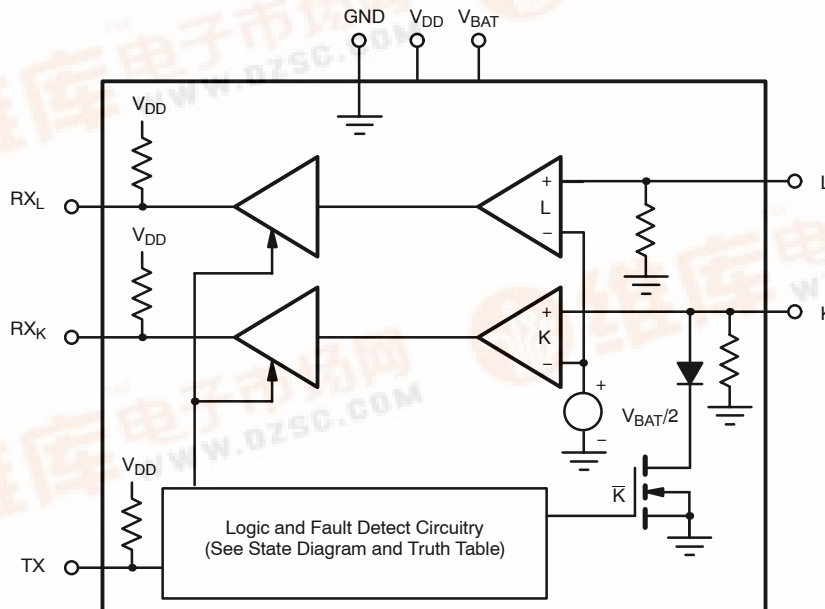

The device incorporates protection against overvoltages and short circuits to V_{BAT} . The transceiver pin is protected and can be driven beyond the V_{BAT} voltage.

The RX output is capable of driving CMOS or $1 \times$ LSTTL load.

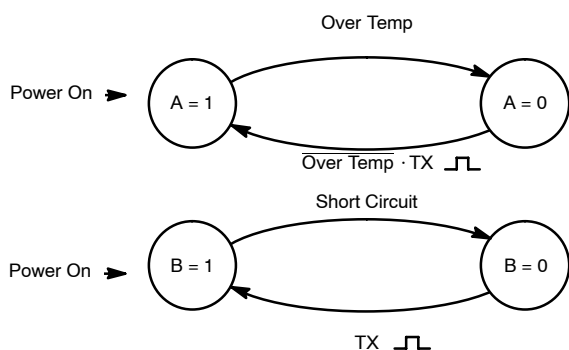

The Si9243AEY is built on the Vishay Siliconix BiC/DMOS process. This process supports bipolar transistors, CMOS, and DMOS. An epitaxial layer prevents latchup.

The Si9243AEY is available in a 8-pin SO package and operates over the automotive temperature range (-40 to 125°C). The Si9243AEY is available in both standard and lead (Pb)-free packages.

FUNCTIONAL DESCRIPTION

The Si9243AEY can be either in transmit or receive mode and it contains over temperature, and short circuit V_{BAT} fault detection circuits.

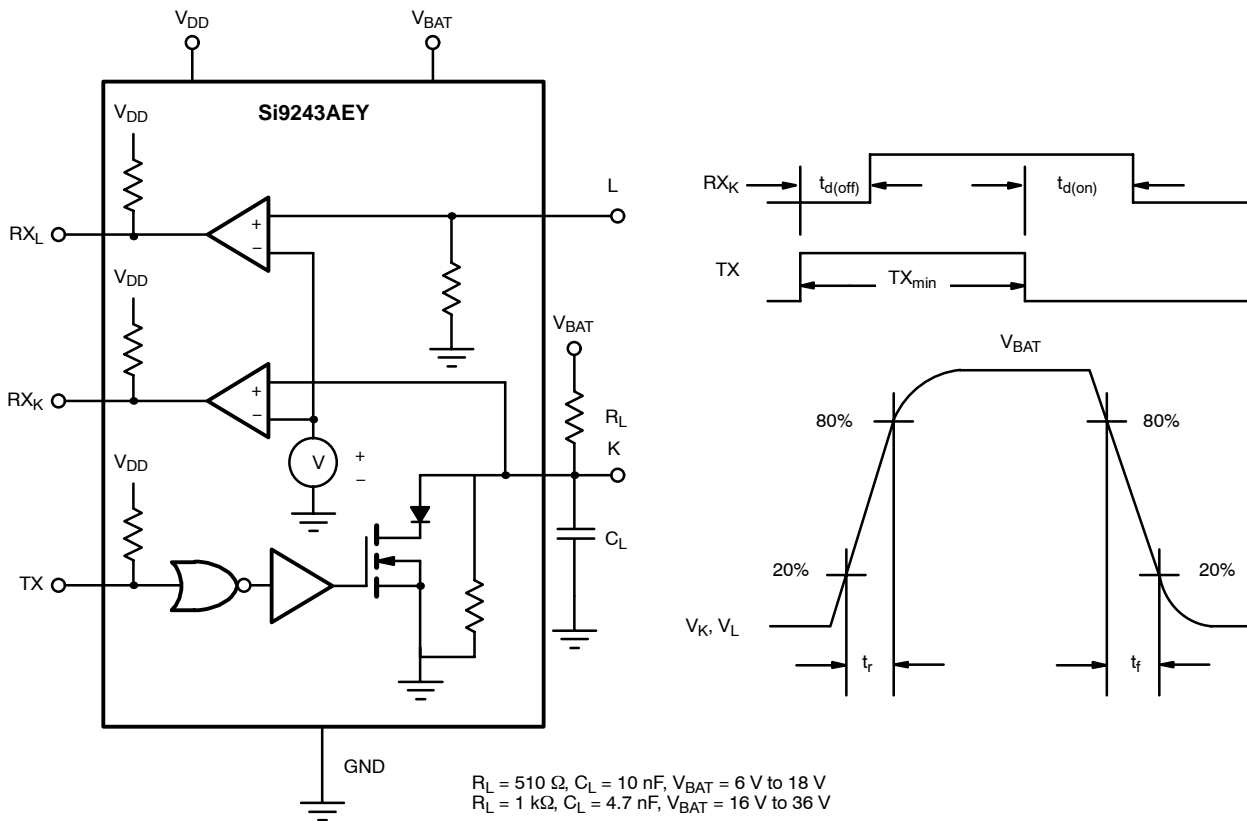

The voltage on the K and L pins are internally compared to V_{BAT/2}. If the voltage on the K or L pin is less than V_{BAT/2} then RX_K or RX_L output will be “low.” If the voltage on the K or L pin is greater than V_{BAT/2} then RX_K or RX_L output will be “high.”

In order to be in transmit mode, TX must be set “low.” The TX signal is then internally inverted and turns the MOSFET on, causing the K pin to be “low.” In transmit mode, the processor

monitors the RX_K and TX. When the two mirror each other there is no fault. In the event of over temperature, or short circuit to V_{BAT}, the Si9243AEY will turn off the K output to protect the IC. The K pin will stay in high impedance and RX_K will follow the K pin. The fault will be reset when TX is toggled high. RX_K, RX_L and TX pins have internal pull up resistor to V_{DD} while K and L pins have internal pull down resistors. When any one of the TX, V_{BAT} or GND pins is open the K output is off.

When the TX pin is set “high” the Si9243AEY is in receive mode and the internal MOSFET is turned off. RX_L and RX_K outputs will follow L and K inputs respectively.
