

L4981A L4981B

POWER FACTOR CORRECTOR

- CONTROL BOOST PWM UP TO 0.99P.F.
- LIMIT LINE CURRENT DISTORTION TO < 5%
- UNIVERSAL INPUT MAINS
- FEED FORWARD LINE AND LOAD REGULATION
- AVERAGE CURRENT MODE PWM FOR MINIMUM NOISE SENSITIVITY
- HIGH CURRENT BIPOLAR AND DMOS TO-TEM POLE OUTPUT
- LOW START-UP CURRENT (0.3mA TYP.)
- UNDER VOLTAGE LOCKOUT WITH HYS-TERESIS AND PROGRAMMABLE TURN ON THRESHOLD
- OVERVOLTAGE, OVERCURRENT PROTEC-TION
- PRECISE 2% ON CHIP REFERENCE EX-TERNALLY AVAILABLE
- SOFT START

MULTIPOWER BCD TECHNOLOGY

DIP20

SO20

ORDERING NUMBERS: L4981X (DIP20)
L4981XD (SO20)

DESCRIPTION

The L4981 I.C. provides the necessary features to achieve a very high power factor up to 0.99. Realized in BCD 60II technology this power factor corrector (PFC) pre-regulator contains all the con-

trol functions for designing a high efficiency-mode power supply with sinusoidal line current consumption.

The L4981 can be easily used in systems with mains voltages between 85V to 265V without any line switch. This new PFC offers the possibility to work at fixed frequency (L4981A) or modulated frequency (L4981B) optimizing the size of the in-

BLOCK DIAGRAM

put filter; both the operating frequency modes working with an average current mode PWM controller, maintaining sinusoidal line current without slope compensation. Besides power MOSFET gate driver, precise voltage reference (externally available), error amplifier, undervoltage lockout, current sense and the

soft start are included. To limit the number of the external components, the device integrates protections as overvoltage and overcurrent. The overcurrent level can be programmed using a simple resistor for L4981A. For a better precision and for L4981B an external divider must be used.

ABSOLUTE MAXIMUM RATINGS

| Symbol | Pin | Parameter | Value | Unit | |
|-----------------------|--------|---|----------------------|-------------|----|
| V _{CC} | 19 | Supply Voltage (I _{CC} ≤ 50mA) (*) | selflimit | V | |
| I _{GDRV} | 20 | Gate driv. output peak current (t = 1μs) | SINK | 2 | A |
| | | | SOURCE | 1.5 | A |
| V _{GDRV} | | Gate driv. output voltage t = 0.1μs | -1 | V | |
| | | Voltages at pins 3, 14, 7, 6, 12, 15 | -0.3 to 9 | V | |

PIN FUNCTIONS

| N. | Name | Description |
|----|--------------------|---|
| 1 | P-GND | Power ground. |
| 2 | IPK | L4981A peak current limiting. A current limitation is obtained using a single resistor connected between Pin 2 and the sense resistor. To have a better precision another resistor between Pin 2 and a reference voltage (Pin 11) must be added. L4981B peak current limiting. A precise current limitation is obtained using two external resistor only. These resistors must be connected between the sense resistor, Pin 2 and the reference voltage. |
| 3 | OVP | Overvoltage protection. At this input are compared an internal precise 5.1V (typ) voltage reference with a sample of the boost output voltage obtained via a resistive voltage divider in order to limit the maximum output peak voltage. |
| 4 | IAC | Input for the AC current. An input current proportional to the rectified mains voltage generates, via a multiplier, the current reference for the current amplifier. |
| 5 | CA-OUT | Current amplifier output. An external RC network determinates the loop gain. |
| 6 | LFF | Load feedforward; this voltage input pin allows to modify the multiplier output current proportionally to the load, in order to give a faster response versus load transient. The best control is obtained working between 1.5V and 5.3V. If this function is not used, connect this pin to the voltage reference (pin = 11). |
| 7 | VRMS | Input for proportional RMS line voltage. the VRMS input compesates the line voltage changes. Connecting a low pass filter between the rectified line and the pin 7, a DC voltage proportional to the input line RMS voltage is obtained. The best control is reached using input voltage between 1.5V and 5.5V. If this function is not used connect this pin to the voltage reference (pin = 11). |
| 8 | MULT-OUT | Multiplier output. This pin common to the multiplier output and the current amplifier N.I. input is an high impedance input like I _{SENSE} . The MULT-OUT pin must be taken not below -0.5V. |
| 9 | I _{SENSE} | Current amplifier inverting input. Care must be taken to avoid this pin goes down -0.5V. |
| 10 | S-GND | Signal ground. |
| 11 | V _{REF} | Output reference voltage (typ = 5.1V). Voltage refence at ± 2% of accuracy externally available, it's internally current limited and can deliver an output current up to 10mA. |
| 12 | SS | A capacitor connected to ground defines the soft start time. An internal current generator delivering 100µA (typ) charges the external capacitor defining the soft start time constant. An internal MOS discharge, the external soft start capacitor both in overvoltage and UVLO conditions. |
| 13 | VA-OUT | Error amplifier output, an RC network fixes the voltage loop gain characteristics. |
| 14 | VFEED | Voltage error amplifier inverting input. This feedback input is connected via a voltage divider to the boost output voltage. |
| 15 | P-UVLO | Programmable under voltage lock out threshold input. A voltage divider between supply voltage and GND can be connected in order to program the turn on threshold. |
| 16 | SYNC (L4981A) | This synchronization input/output pin is CMOS logic compatible. Operating as SYNC in, a rectangular wave must be applied at this pin. Opearting as SYNC out, a rectangular clock pulse train is available to synchronize other devices. |
| | FREQ-MOD (L4981B) | Frequency modulation current input. An external resistor must be connected between pin 16 and the rectified line voltage in order to modulate the oscillator frequency. Connecting pin 16 to ground a fixed frequency imposed by R _{OSC} and C _{OSC} is obtained. |
| 17 | R _{OSC} | An external resistor connected to ground fixes the constant charging current of C _{OSC} . |
| 18 | C _{OSC} | An external capacitor connected to GND fixes the switching frequency. |
| 19 | V _{CC} | Supply input voltage. |
| 20 | GDRV | Output gate driver. Bipolar and DMOS transistors totem pole output stage can deliver peak current in excess 1A useful to drive MOSFET or IGBT power stages. |
