# 74ACQ543• 74ACTQ543 Quiet Series™ Octal Registered Transceiver with 3-STATE Outputs

#### **General Description**

The ACQ/ACTQ543 is a non-inverting octal transceiver containing two sets of D-type registers for temporary storage of data flowing in either direction. Separate Latch Enable and Output Enable inputs are provided for each register to permit independent input and output control in either direction of data flow.

The ACQ/ACTQ utilizes Fairchild Quiet Series™ technology to guarantee quiet output switching and improved dynamic threshold performance FACT Quiet Series™ features GTO™ output control and undershoot corrector in addition to a split ground bus for superior performance.

#### **Features**

- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Guaranteed pin-to-pin skew AC performance
- 8-bit octal latched transceiver
- Separate controls for data flow in each direction
- Back-to-back registers for storage
- Outputs source/sink 24 mA
- 300 mil slim PDIP/SOIC

#### Ordering Code:

Order Number	Package Number	Package Description
74ACQ543SC	M24B	24-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300 Wide
74ACQ543SPC	N24C	24-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide
74ACTQ543SC	M24B	24-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300 Wide
74ACTQ543QSC	MQA24	24-Lead Quarter Size Outline Package (QSOP), JEDEC MO-137, 0.150 Wide
74ACTQ543SPC	N24C	24-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the order code.

#### **Pin Descriptions**

Pin Names	Description
OEAB	A-to-B Output Enable Input (Active LOW)
OEBA	B-to-A Output Enable Input (Active LOW)
CEAB	A-to-B Enable Input (Active LOW)
CEBA	B-to-A Enable Input (Active LOW)
LEAB	A-to-B Latch Enable Input (Active LOW)
LEBA	B-to-A Latch Enable Input (Active LOW)
A <sub>0</sub> -A <sub>7</sub>	A-to-B Data Inputs or
	B-to-A 3-STATE Outputs
B <sub>0</sub> –B <sub>7</sub>	B-to-A Data Inputs or
	A-to-B 3-STATE Outputs

FACT™, Quiet Series™, FACT Quiet Series™ and GTO™ are trademarks of Fairchild Semiconductor Corporation.

# **Logic Symbols**

#### IEEE/IEC

#### **Functional Description**

The ACQ/ACTQ543 contains two sets of eight D-type latches, with separate input and output controls for each set. For data flow from A to B, for example, the A-to-B Enable (CEAB) input must be LOW in order to enter data from  $A_0$ – $A_7$  or take data from  $B_0$ – $B_7$ , as indicated in the Data I/O Control Table. With CEAB LOW, a LOW signal on the A-to-B Latch Enable (LEAB) input makes the A-to-B latches transparent; a subsequent LOW-to-HIGH transition of the LEAB signal puts the A latches in the storage mode and their outputs no longer change with the A inputs. With CEAB and OEAB both LOW, the 3-STATE B output buffers are active and reflect the data present at the output of the A latches. Control of data flow from B to A is similar, but using the CEBA, LEBA and OEBA inputs

#### Data I/O Control Table

	Inputs		Latab Status	Output Buffers
CEAE	LEAB	OEAB	Latch Status	Output Buffers
Н	Х	Χ	Latched	High Z
Х	Н	Χ	Latched	_
L	L	Χ	Transparent	_
Х	X	Н	_	High Z
L	Х	L	_	Driving

- H = HIGH Voltage Level
- L = LOW Voltage Level
- X = Immaterial

A-to-B data flow shown; B-to-A flow control is the same, except using  $\overline{\text{CEBA}}, \overline{\text{LEBA}}$  and  $\overline{\text{OEBA}}$ 

#### **Logic Diagram**

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

#### **Absolute Maximum Ratings**(Note 1)

Supply Voltage ( $V_{CC}$ ) -0.5V to +7.0V

DC Input Diode Current (I<sub>IK</sub>)

 $\begin{array}{c} \rm V_I = -0.5V & -20~mA \\ \\ \rm V_I = V_{CC} + 0.5V & +20~mA \\ \\ \rm DC~Input~Voltage~(V_I) & -0.5V~to~V_{CC} + 0.5V \end{array}$ 

DC Output Diode Current ( $I_{OK}$ )

 $\begin{aligned} \text{V}_{\text{O}} &= -0.5 \text{V} & -20 \text{ mA} \\ \text{V}_{\text{O}} &= \text{V}_{\text{CC}} + 0.5 \text{V} & +20 \text{ mA} \end{aligned}$

#### **FACT Noise Characteristics**

The setup of a noise characteristics measurement is critical to the accuracy and repeatability of the tests. The following is a brief description of the setup used to measure the noise characteristics of FACT.

#### Equipment:

Hewlett Packard Model 8180A Word Generator PC-163A Test Fixture

Tektronics Model 7854 Oscilloscope

#### Procedure:

- 1. Verify Test Fixture Loading: Standard Load 50 pF,  $500\Omega$ .
- Deskew the HFS generator so that no two channels have greater than 150 ps skew between them. This requires that the oscilloscope be deskewed first. It is important to deskew the HFS generator channels before testing. This will ensure that the outputs switch simultaneously.
- Terminate all inputs and outputs to ensure proper loading of the outputs and that the input levels are at the correct voltage.
- Set the HFS generator to toggle all but one output at a frequency of 1 MHz. Greater frequencies will increase DUT heating and effect the results of the measurement
- Set the HFS generator input levels at 0V LOW and 3V HIGH for ACT devices and 0V LOW and 5V HIGH for AC devices. Verify levels with an oscilloscope.

FIGURE 1. Quiet Output Noise Voltage Waveforms

Note 19:  $V_{OHV}$  and  $V_{OLP}$  are measured with respect to ground reference. Note 20: Input pulses have the following characteristics: f=1 MHz,  $t_r=3$  ns,  $t_r=3$  ns, skew < 150 ps.

#### V<sub>OLP</sub>/V<sub>OLV</sub> and V<sub>OHP</sub>/V<sub>OHV</sub>:

- Determine the quiet output pin that demonstrates the greatest noise levels. The worst case pin will usually be the furthest from the ground pin. Monitor the output voltages using a 50Ω coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- Measure V<sub>OLP</sub> and V<sub>OLV</sub> on the quiet output during the worst case transition for active and enable. Measure V<sub>OHP</sub> and V<sub>OHV</sub> on the quiet output during the worst case active and enable transition.
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.

#### V<sub>ILD</sub> and V<sub>IHD</sub>:

- Monitor one of the switching outputs using a  $50\Omega$  coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- First increase the input LOW voltage level, V<sub>IL</sub>, until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds V<sub>IL</sub> limits, or on output HIGH levels that exceed V<sub>IH</sub> limits. The input LOW voltage level at which oscillation occurs is defined as V<sub>ILD</sub>.
- Next decrease the input HIGH voltage level,  $V_{IH}$ , until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds  $V_{IL}$  limits, or on output HIGH levels that exceed  $V_{IH}$  limits. The input HIGH voltage level at which oscillation occurs is defined as  $V_{IHD}$
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability on the measurements.
