

## **TPS3808-Q1**

SBVS085F-JANUARY 2007-REVISED JUNE 2010

# LOW-QUIESCENT-CURRENT PROGRAMMABLE-DELAY SUPERVISORY CIRCUIT

### FEATURES

www.ti.com

- Qualified for Automotive Applications
- Power-On Reset Generator With Adjustable Delay Time: 1.25 ms to 10 s
- Very Low Quiescent Current: 2.4 µA Typ
- High Threshold Accuracy: 0.5% Typ
- Fixed Threshold Voltages for Standard Voltage Rails From 1.2 V to 5 V and Adjustable Voltage Down to 0.4 V Are Available
- Manual Reset (MR) Input
- **Open-Drain RESET Output**
- Temperature Range: -40°C to 125°C
- Small SOT-23 Package

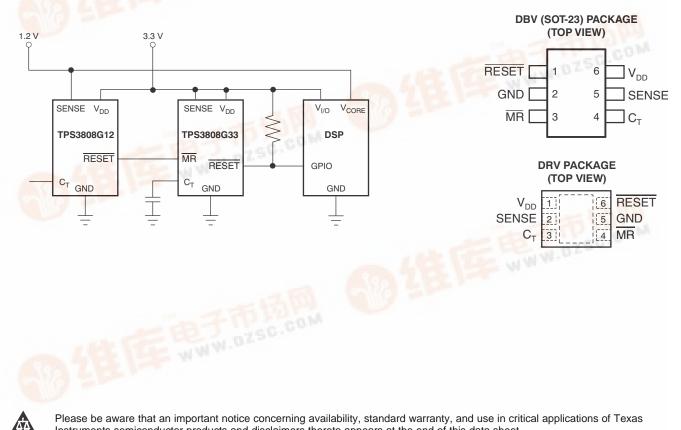

### APPLICATIONS

- **DSP or Microcontroller Applications**
- **Notebook/Desktop Computers**
- **PDAs/Hand-Held Products**
- W.DZSC.COM Portable/Battery-Powered Products
- **FPGA/ASIC Applications** W W

### DESCRIPTION

The TPS3808 microprocessor supervisory circuits monitor system voltages from 0.4 V to 5 V, asserting an open-drain **RESET** signal when the SENSE voltage drops below a preset threshold or when the manual reset (MR) pin drops to a logic low. The RESET output remains low for the user-adjustable delay time after the SENSE voltage and MR return above their thresholds.

The TPS3808 uses a precision reference to achieve 0.5% threshold accuracy for  $V_{IT} \leq 3.3$  V. The reset delay time can be set to 20 ms by disconnecting the  $C_T$  pin, 300 ms by connecting the  $C_T$  pin to  $V_{DD}$  using a resistor, or can be user adjusted between 1.25 ms and 10 s by connecting the  $C_T$  pin to an external capacitor. The TPS3808 has a very low typical quiescent current of 2.4 µA, so it is well suited to battery-powered applications. It is available in a small SOT-23 package and is fully specified over a temperature range of -40°C to 125°C (T<sub>1</sub>).

Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

www.ti.com

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## FUNCTIONAL BLOCK DIAGRAMS

#### **PIN ASSIGNMENTS**

#### **PIN FUNCTIONS**

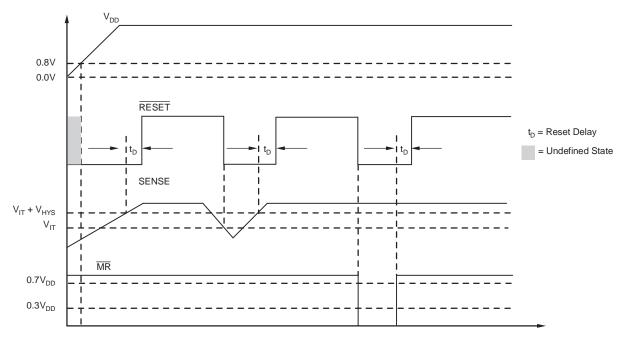

PIN		DESCRIPTION					
NAME	NO.	DESCRIPTION					
RESET	1	Reset. This is an open-drain output that is driven to a low impedance state when RESET is asserted (either the SENSE input is lower than the threshold voltage (V <sub>IT</sub> ) or the MR pin is set to a logic low). RESET remains low (asserted) for the reset period after both SENSE is above V <sub>IT</sub> and MR is set to a logic high. A pullup resistor from 10 k $\Omega$ to 1 M $\Omega$ should be used on this pin, and allows the reset pin to attain voltages higher than V <sub>DD</sub> .					
GND	2	Ground					
MR	3	Manual reset. Driving this pin low asserts $\overline{\text{RESET}}$ . $\overline{\text{MR}}$ is internally tied to $V_{\text{DD}}$ by a 90-k $\Omega$ pullup resistor.					
C <sub>T</sub>	4	Reset period programming. Connecting this pin to $V_{DD}$ through a 40-k $\Omega$ to 200-k $\Omega$ resistor or leaving it open results in fixed delay times (see <i>Electrical Characteristics</i> ). Connecting this pin to a ground referenced capacitor $\geq$ 100 pF gives a user-programmable delay time.					
SENSE	5	Voltage sense. This pin is connected to the voltage to be monitored. If the voltage at this terminal drops below the threshold voltage ( $V_{IT}$ ), RESET is asserted.					
V <sub>DD</sub>	6	Supply voltage. It is good analog design practice to place a 0.1-µF ceramic capacitor close to this pin.

#### SBVS085F-JANUARY 2007-REVISED JUNE 2010

# <u>₩豐椅呷P\$3808G01-Q1"供应商</u>

#### **TYPICAL CHARACTERISTICS (continued)**

LOW-LEVEL RESET VOLTAGE

www.ti.com

#### **DEVICE OPERATION**

The TPS3808 microprocessor supervisory product family is designed to assert a RESET signal when either the SENSE pin voltage drops below  $V_{IT}$  or the manual reset (MR) is driven low. The RESET output remains asserted for a user-adjustable time after both the manual reset (MR) and SENSE voltages return above the respective thresholds. A broad range of voltage threshold and reset delay time adjustments are available, allowing these devices to be used in a wide array of applications. Reset threshold voltages can be factory-set from 0.82 V to 3.3 V or from 4.4 V to 5.0 V, while the TPS3808G01 can be set to any voltage above 0.405 V using an external resistor divider. Two preset delay times are also user-selectable: connecting the C<sub>T</sub> pin to V<sub>DD</sub> results in a 300-ms reset delay, while leaving the C<sub>T</sub> pin open yields a 20-ms reset delay. In addition, connecting a capacitor between C<sub>T</sub> and GND allows the designer to select any reset delay period from 1.25 ms to 10 s.

#### SENSE Input

The SENSE input <u>provides</u> a terminal at which any system voltage can be monitored. If the voltage on <u>this pin</u> drops below  $V_{IT}$ , RESET is asserted. The comparator has a built-in hysteresis to ensure smooth RESET assertions and deassertions. It is good analog design practice to put a 1-nF to 10-nF bypass capacitor on the SENSE input to reduce sensitivity to transients and layout parasitics.

The TPS3808G01 can be used to monitor any voltage rail down to 0.405 V using the circuit shown in Figure 9.

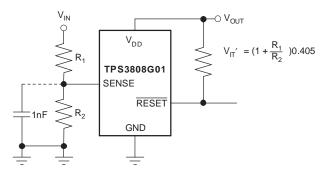

Figure 9. Using the TPS3808G01 to Monitor a User-Defined Threshold Voltage

### Manual Reset (MR) Input

<u>The</u> manual reset ( $\overline{MR}$ ) input allows a processor or other logic circuits to initiate a reset. A logic low (0.3 V<sub>DD</sub>) on MR causes RESET to assert. After MR returns to a logic high and SENSE is above its reset threshold, RESET is deasserted after the user-defined reset delay expires. Note that MR is internally tied to V<sub>DD</sub> using a 90-k $\Omega$  resistor, so this pin can be left unconnected if MR is not used.

See Figure 10 for how  $\overline{\text{MR}}$  can be used to monitor multiple system voltages. Note that if the logic signal driving  $\overline{\text{MR}}$  does not go fully to V<sub>DD</sub>, there will be some additional current draw into V<sub>DD</sub> as a result of the internal pullup resistor on MR. To minimize current draw, a logic-level FET can be used as shown in Figure 11.

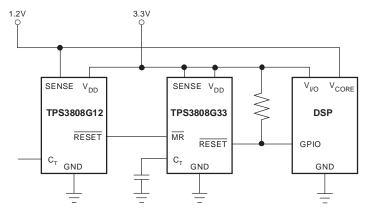

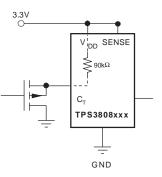

Figure 10. Using MR to Monitor Multiple System Voltages

SBVS085F-JANUARY 2007-REVISED JUNE 2010

#### Figure 11. Using an External MOSFET to Minimize I<sub>DD</sub> When MR Signal Does Not Go to V<sub>DD</sub>

#### Selecting the Reset Delay Time

The TPS3808 has three options for setting the RESET delay time as shown in Figure 12. Figure 12a shows the configuration for a fixed 300-ms typical delay time by tying  $C_T$  to  $V_{DD}$ ; a resistor from 40 k $\Omega$  to 200 k $\Omega$  must be used. Supply current is not affected by the choice of resistor. Figure 12b shows a fixed 20-ms delay time by leaving the  $C_T$  pin open. Figure 12c shows a ground referenced capacitor connected to  $C_T$  for a user-defined program time between 1.25 ms and 10 s.

The capacitor  $C_T$  should be  $\geq 100 \text{ pF}$  nominal value in order for the TPS3808 to recognize that the capacitor is present. The capacitor value for a given delay time can be calculated using the following equation:

$$C_{T} (nF) = |t_{D} (s) - 0.5 \times 10^{-3} (s)| \times 175$$

(1)

The reset delay time is determined by the time it takes an on-chip precision 220-nA current source to charge the external capacitor to 1.23 V. When a RESET is asserted, the capacitor is discharged. When the RESET conditions are cleared, the internal current source is enabled and begins to charge the external capacitor. When the voltage on this capacitor reaches 1.23 V, RESET is deasserted. Note that a low-leakage type capacitor such as a ceramic should be used and that stray capacitance around this pin may cause errors in the reset delay time.

#### Immunity to SENSE Pin Voltage Transients

The TPS3808 is relatively immune to short negative transients on the SENSE pin. Sensitivity to transients is dependent on threshold overdrive, as shown in the *Maximum Transient Duration at Sense vs Sense Threshold Overdrive Voltage* graph (Figure 5) in the Typical Characteristics section.

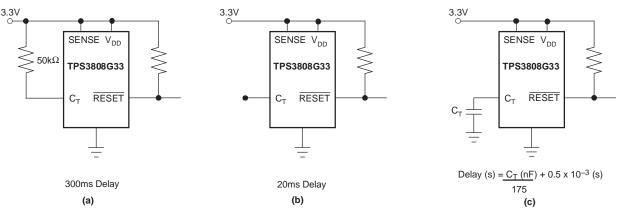

Figure 12. Configuration Used to Set the RESET Delay Time

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new **PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www. information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for **Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retard in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
