National Semiconductor

LME49721
High Performance, High Fidelity Rail-to-Rail Input/Output Audio Operational Amplifier

General Description

The LME49721 is a low distortion, low noise Rail-to-Rail Input/Output operational amplifier optimized and fully specified for high performance, high fidelity applications. Combining advanced leading-edge process technology with state-of-the-art circuit design, the LME49721 Rail-to-Rail Input/Output operational amplifier delivers superior signal amplification for outstanding performance. The LME49721 combines a very high slew rate with low THD+N to easily satisfy demanding applications. To ensure that the most challenging loads are driven without compromise, the LME49721 has a high slew rate of ±8.5V/µs and an output current capability of ±9.7mA. Further, dynamic range is maximized by an output stage that drives 10kΩ loads to within 10mV of either power supply voltage.

The LME49721 has a wide supply range of 2.2V to 5.5V. Over this supply range the LME49721's input circuitry maintains excellent common-mode and power supply rejection, as well as maintaining its low input bias current. The LME49721 is unity gain stable.

Key Specifications

- Power Supply Voltage Range   2.2V to 5.5V
- Quiescent Current   2.15mA (typ)
-

THD+N ($A_V = 2$, $V_{OUT} = 4V_{p-p}$, $f_{IN} = 1kHz$)

    $R_L = 2k\Omega$ 0.00008% (typ)

    $R_L = 600\Omega$ 0.0001% (typ)

- Input Noise Density $4nV/\sqrt{Hz}$ (typ), @ 1kHz
- Slew Rate   ±8.5V/µs (typ)

- Gain Bandwidth Product   20MHz (typ)
- Open Loop Gain ($R_L = 600\Omega$)   118dB (typ)
- Input Bias Current   40fA (typ)
- Input Offset Voltage   0.3mV (typ)
- PSRR   103dB (typ)

Features

- Rail-to-rail Input and Output
- Easily drives 10kΩ loads to within 10mV of each power supply voltage
- Optimized for superior audio signal fidelity
- Output short circuit protection

Applications

- Ultra high quality portable audio amplification
- High fidelity preamplifiers
- High fidelity multimedia
- State of the art phono pre amps
- High performance professional audio
- High fidelity equalization and crossover networks
- High performance line drivers
- High performance line receivers
- High fidelity active filters
- DAC I–V converter
- ADC front-end signal conditioning

Note 1: "*Absolute Maximum Ratings*" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the *Absolute Maximum Ratings* or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified

Note 2: The *Electrical Characteristics* tables list guaranteed specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics Conditions* and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 3: The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX}, θ_{JA}, and the ambient temperature, T_A. The maximum allowable power dissipation is $P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA}$ or the number given in *Absolute Maximum Ratings*, whichever is lower.

Note 4: Human body model, applicable std. JESD22-A114C.

Note 5: Machine model, applicable std. JESD22-A115-A.

Note 6: Typical values represent most likely parametric norms at T_A = +25ºC, and at the *Recommended Operation Conditions* at the time of product characterization and are not guaranteed.

Note 7: Datasheet min/max specification limits are guaranteed by test or statistical analysis.

Typical Performance Characteristics Graphs were taken in dual supply configuration.

Application Information
"LME49721MA"
DISTORTION MEASUREMENTS

The vanishingly low residual distortion produced by LME49721 is below the capabilities of all commercially available equipment. This makes distortion measurements just slightly more difficult than simply connecting a distortion meter to the amplifier's inputs and outputs. The solution, however, is quite simple: an additional resistor. Adding this resistor extends the resolution of the distortion measurement equipment.

The LME49721's low residual is an input referred internal error. As shown in Figure 1, adding the 10Ω resistor connected between athe amplifier's inverting and non-inverting inputs changes the amplifier's noise gain. The result is that the error signal (distortion) is amplified by a factor of 101. Although the amplifier's closed-loop gain is unaltered, the feedback available to correct distortion errors is reduced by 101. To ensure minimum effects on distortion measurements, keep the value of R1 low as shown in Figure 1.

This technique is verified by duplicating the measurements with high closed loop gain and/or making the measurements at high frequencies. Doing so, produces distortion components that are within equipments capabilities. This datasheet's THD+N and IMD values were generated using the above described circuit connected to an Audio Precision System Two Cascade.

Distortion Signal Gain = 1 + (R2/R3)
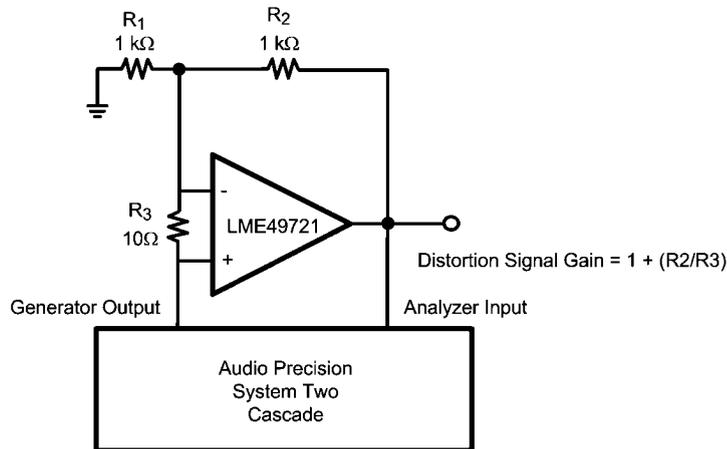

FIGURE 1. THD+N and IMD Distortion Test Circuit with $A_V = 2$

OPERATING RATINGS AND BASIC DESIGN GUIDELINES

The LME49721 has a supply voltage range from +2.2V to +5.5V single supply or ±1.1 to ±2.75V dual supply.

Bypassed capacitors for the supplies should be placed as close to the amplifier as possible. This will help minimize any inductance between the power supply and the supply pins. In addition to a 10µF capacitor, a 0.1µF capacitor is also recommended in CMOS amplifiers.

The amplifier's inputs lead lengths should also be as short as possible. If the op amp does not have a bypass capacitor, it may oscillate.

BASIC AMPLIFIER CONFIGURATIONS

The LME49721 may be operated with either a single supply or dual supplies. Figure 2 shows the typical connection for a single supply inverting amplifier. The output voltage for a single supply amplifier will be centered around the common-mode voltage Vcm. Note, the voltage applied to the Vcm insures the output stays above ground. Typically, the Vcm should be equal to $V_{DD}/2$. This is done by putting a resistor divider ckt at this node, see Figure 2.

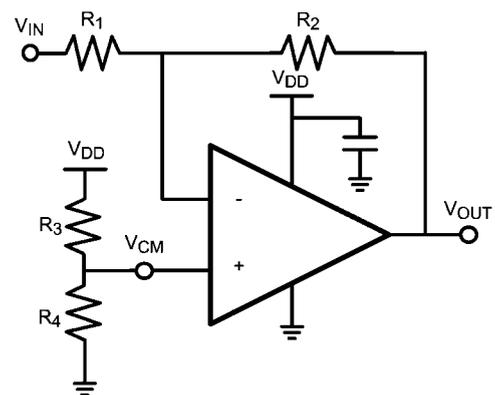

FIGURE 2. Single Supply Inverting Op Amp

Figure 3 shows the typical connection for a dual supply inverting amplifier. The output voltage is centered on zero.

LME49721MA
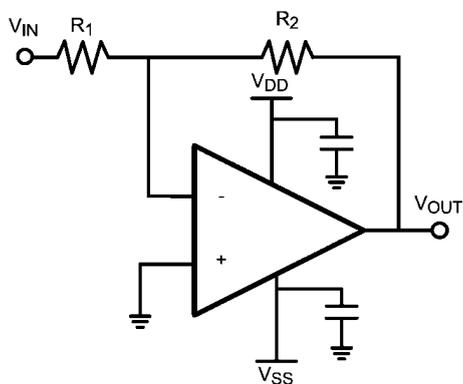

202049n2

FIGURE 3. Dual Supply Inverting Op Amp

Figure 4 shows the typical connection for the Buffer Amplifier or also called a Voltage Follower. A Buffer Amplifier can be used to solve impedance matching problems, to reduce pow-

er consumption in the source, or to drive heavy loads. The input impedance of the op amp is very high. Therefore, the input of the op amp does not load down the source. The output impedance on the other hand is very low. It allows the load to either supply or absorb energy to a circuit while a secondary voltage source dissipates energy from a circuit. The Buffer is a unity stable amplifier, 1V/V. Although the feedback loop is tied from the output of the amplifier to the inverting input, the gain is still positive. Note, if a positive feedback is used, the amplifier will most likely drive to either rail at the output.

$$f_0 = \frac{1}{2\pi C1 R1}, \quad Q = \frac{1}{2}\left(1 + \frac{R2}{R0} + \frac{R2}{RG}\right), \quad A_{BP} = QA_{LP} = QA_{LH} = \frac{R2}{RG}$$

Illustration is f_0 = 1 kHz, Q = 10, A_{BP} = 1

202049o5

$$f_L = \frac{1}{2\pi R2C1}, \quad f_{LB} = \frac{1}{2\pi R1C1}$$

$$f_H = \frac{1}{2\pi R5C2}, \quad f_{HB} = \frac{1}{2\pi(R1 + R5 + 2R3)C2}$$

Illustration is:

  f_L = 32 Hz, f_{LB} = 320 Hz

  f_H =11 kHz, f_{HB} = 1.1 kHz

202049o6

RIAA Preamp
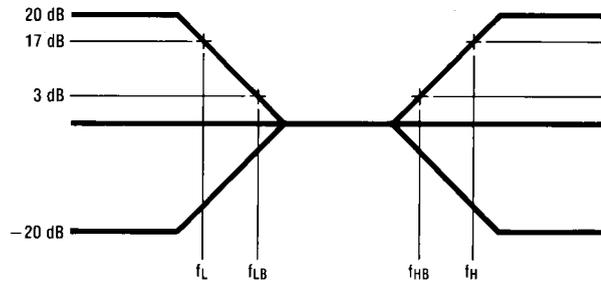

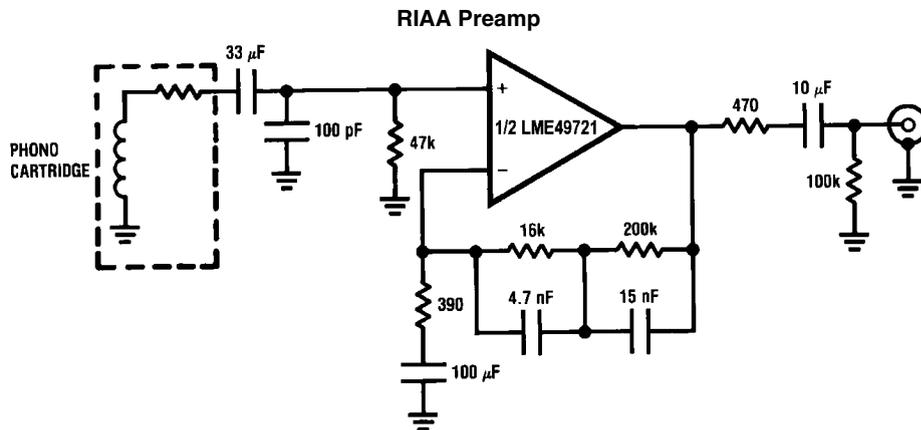

202049o8

A_v = 35 dB

E_n = 0.33 μV

S/N = 90 dB

f = 1 kHz

A Weighted

A Weighted, V_{IN} = 10 mV

@f = 1 kHz
