

## MM58248 High Voltage Display Driver

### General Description

The MM58248 is a monolithic MOS integrated circuit utilizing CMOS metal gate low threshold P- and N-channel devices. It is available both in 40-pin molded dual-in-line packages or as dice. The MM58248 is particularly suited for driving high voltage (60V max) vacuum fluorescent (VF) displays (e.g., a 5 x 7 dot matrix display).

### Applications

- COPST<sup>™</sup> or microprocessor-driven display
- Instrumentation readouts
- Industrial control indicator
- Digital clock, thermostat, counter, voltmeter
- Word processor text displays
- Automotive dashboards

### Features

- Direct interface to high voltage display
- Serial data input
- No external resistors required
- Wide display power supply operation
- LSTTL compatible inputs
- Software compatible with NS display driver family
- Compatible with alphanumeric or dot matrix displays
- No load signal required

## Functional Description

This product is specifically designed to drive multiplexed or non-multiplexed high voltage alphanumeric or dot matrix vacuum fluorescent (VF) displays. Character generation is done externally in the microprocessor, with a serial data path to the display driver. The MM58248 uses two signals, DATA IN and CLOCK, with a format of a leading '1' followed by the 35 data bits, hence allowing data transfer without an additional signal. A block diagram of the MM58248 is shown in Figure 1.

Figure 2 shows the pinout of the MM58248 device, where output 1 (pin 18) is equivalent to bit 1, i.e., the first bit of data to be loaded into the shift register following the start bit. A logic '1' at the input will turn on the corresponding display digit/segment/dot output.

A significant reduction in discrete board components can be achieved by the use of the MM58248, because external pull-down resistors are not required. Due to the nature of the output stage, both its on and off impedance values vary as a function of the display voltage applied. However, Figures 3a and 3b show that this output impedance will remain constant for a fixed value of display voltage.

Figure 4 demonstrates the critical timing requirements between CLOCK and DATA IN for the MM58248.

In Figure 5, a start bit of logic '1' precedes the 35 bits of data, each bit being accepted on the rising edge of CLOCK, i.e., a '0'-'1' transition. At the 36th clock, a LOAD signal is generated synchronously with the high state of the clock, thus loading the 35 bits of the shift register into the latches. At the low state of the clock, a RESET signal is generated, clearing all bits of the shift register for the next set of data. Hence, a complete set of 36 clock pulses is needed for the MM58248, or the shift register will not clear. To clear (reset) the display driver at 'power on' or any time, the following flushing routine may be used. Clock in 36 "zeroes", followed by a "one" (start bit), followed by 35 "zeroes". This procedure will completely blank the display. It is recommended to clear the driver at power on.

Figure 6 shows a schematic diagram of a microprocessor-based system where the MM58248 is used to provide the anode drive for a 32-digit 5 x 7 dot matrix vacuum fluorescent (VF) display. The grid drive in this example is provided by another member of the high voltage display driver family, namely the MM58241, which has the additional features of a BLANKING CONTROL pin, a DATA OUT pin, and an ENABLE (external load signal) pin.
