- 1/ Unused inputs that do not directly control the pin under test must be put at ≥ 2.5 V or ≤ 0.4 V. No unused inputs shall exceed 5.5 V or go less than 0.0 V. No inputs shall be floated.
- 2/ All outputs must be tested. In the case where only one input at V_{IL} maximum or V_{IH} minimum produces the proper state, the test must be performed with each input being selected as the V_{IL} maximum or V_{IH} minimum input.
- 3/ For I/O ports, the parameters I_{IH2} and I_{IL} include the off-state output current.
- 4/ The output conditions have been chosen to produce a current that closely approximates one half of the true short circuit output current, I_{OS}. Not more than one output will be tested at one time and duration of the test condition shall not exceed one second.
- 5/ Functional tests shall be conducted at input test conditions of GND ≤ V_{IL} ≤ V_{OL} and V_{OH} ≤ V_{IH} ≤ V_{CC}.
- 6/ Propagation delay limits are based on single output switching. Unused inputs = 3.5 V or ≤ 0.3 V.
- 7/ These parameters are measured with the internal output state of the storage register opposite to that of the bus input.

4.3 Quality conformance inspection. Quality conformance inspection shall be in accordance with method 5005 of MIL-STD-883 including groups A, B, C, and D inspections. The following additional criteria shall apply.

4.3.1 Group A inspection.

- a. Tests shall be as specified in table II herein.
- b. Subgroups 4, 5, and 6 in table I, method 5005 of MIL-STD-883 shall be omitted.
- c. Subgroups 7 and 8 shall verify the truth table as specified on figure 2.
