105 dB, 192 kHz, Multi-bit Audio A/D Converter

Features

♦ Advanced Multi-bit Delta-Sigma Architecture

♦ 24-bit Conversion

♦ Supports All Audio Sample Rates Including 192 kHz

♦ 105 dB Dynamic Range at 5 V

♦ -98 dB THD+N

♦ 90 mW Power Consumption

♦ High-Pass Filter to Remove DC Offsets

♦ Analog/Digital Core Supplies from 3.3 V to 5 V

♦ Supports Logic Levels between 2.5 V and 5 V

♦ Low-Latency Digital Filter

♦ Auto-detect Mode Selection in Slave Mode

♦ Auto-Detect MCLK Divider

♦ Supports 384x MCLK/LRCK Ratios

General Description

The CS5342 is a complete analog-to-digital converter for digital audio systems. It performs sampling, analog-to-digital conversion and anti-alias filtering, generating 24-bit values for both left and right inputs in serial form at sample rates up to 200 kHz per channel.

The CS5342 uses a 5th-order, multi-bit Delta-Sigma modulator followed by digital filtering and decimation, which removes the need for an external anti-alias filter.

The CS5342 is available in a 16-pin TSSOP package in Commercial grade (-10° to 70° C). The CDB5342 Customer Demonstration board is also available for device evaluation and implementation suggestions. Please refer to "Ordering Information" on page 21 for complete ordering information.

The CS5342 is ideal for audio systems requiring wide dynamic range, negligible distortion and low noise, such as set-top boxes, DVD-karaoke players, DVD recorders, A/V receivers, and automotive applications.
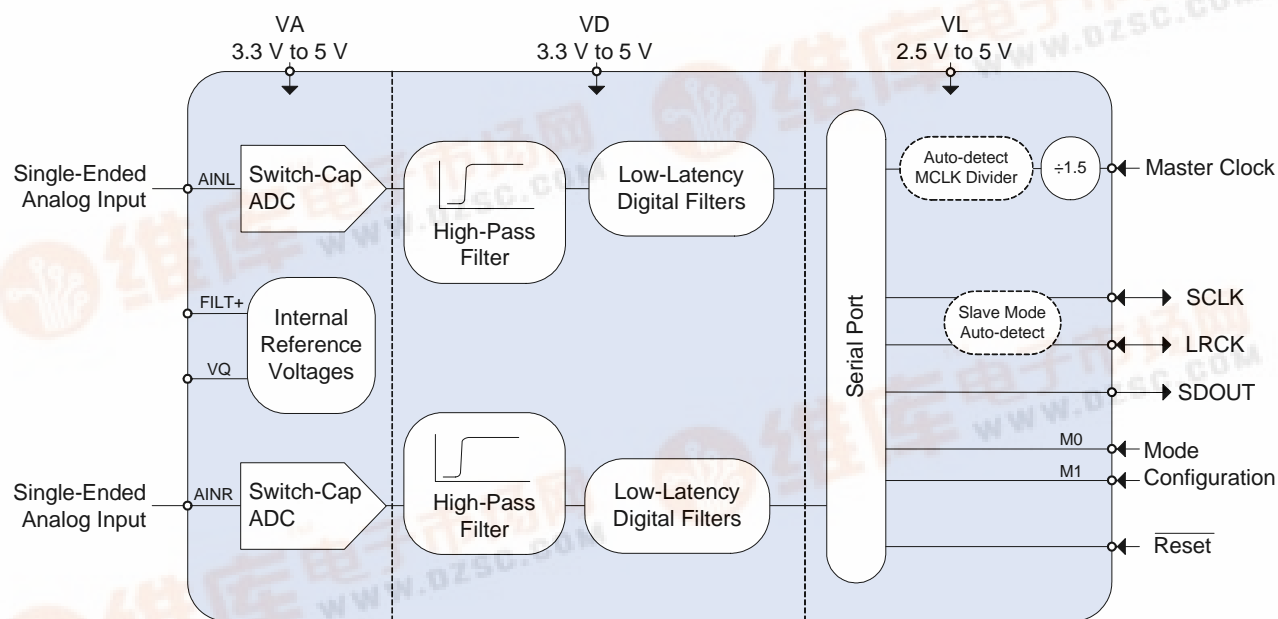

TABLE OF CONTENTS

LIST OF FIGURES

"CS5342_CG"

LIST OF TABLES

1. CHARACTERISTICS AND SPECIFICATIONS

(All Min/Max characteristics and specifications are guaranteed over the Specified Operating Conditions. Typical performance characteristics and specifications are derived from measurements taken at typical supply voltages and T_A = 25°C.)

SPECIFIED OPERATING CONDITIONS

(GND = 0 V, all voltages with respect to 0 V.)

Parameter		Symbol	Min	Typ	Max	Unit
Power Supplies (Note 2, 3)	Analog	VA	3.1	(Note 1)	5.25	V
	Digital	VD	3.1	3.3	5.25	V
	Logic	VL	2.38	3.3	5.25	V
Ambient Operating Temperature	Commercial (-CZZ)	T_{AC}	-10	-	70	°C

Notes:

1. This part is specified at typical analog voltages of 3.3 V and 5.0 V. See "Analog Characteristics (CS5342-CZZ)" on page 5 for details.

2. In Quad-Speed Slave Mode, the CS5342 is only specified for operation with VA and VD at 5 V, ±5%.

ABSOLUTE MAXIMUM RATINGS

(GND = 0 V, All voltages with respect to ground.) (Note 3)

Parameter		Symbol	Min	Max	Units
DC Power Supplies:	Analog	VA	-0.3	+6.0	V
	Logic	VL	-0.3	+6.0	V
	Digital	VD	-0.3	+6.0	V
Input Current	(Note 4)	I_{in}	-10	+10	mA
Analog Input Voltage	(Note 5)	V_{IN}	GND-0.7	VA+0.7	V
Digital Input Voltage	(Note 5)	V_{IND}	-0.7	VL+0.7	V
Ambient Operating Temperature (Power Applied)		T_A	-50	+95	°C
Storage Temperature		T_{stg}	-65	+150	°C

3. Operation beyond these limits may result in permanent damage to the device.
   Normal operation is not guaranteed at these extremes.

4. Any pin except supplies. Transient currents of up to ±100 mA on the analog input pins will not cause SRC latch-up.

5. The maximum over/under voltage is limited by the input current.

ANALOG CHARACTERISTICS (CS5342-CZZ)

Test conditions (unless otherwise specified): Input test signal is a 1 kHz sine wave; measurement bandwidth is 10 Hz to 20 kHz.

Figure 17. Typical Connection Diagram

4. APPLICATIONS

4.1 Single-, Double-, and Quad-Speed Modes

The CS5342 can support output sample rates from 2 kHz to 200 kHz. The proper speed mode can be determined by the desired output sample rate and the external MCLK/LRCK ratio, as shown in Table 1.

Speed Mode	MCLK/LRCK Ratio	Output Sample Rate Range (kHz)
Single-Speed Mode	768x	43 - 50
	384x	2 - 50
Double-Speed Mode	384x	86 - 100
	192x	50 - 100
Quad-Speed Mode	192x	172 - 200
	96x*	100 - 200
* Quad-Speed Mode, 96x only available in Master Mode.		

Table 1. Speed Modes and the Associated Output Sample Rates (Fs)

4.2 Operation as Either a Clock Master or Slave

The CS5342 supports operation as either a clock master or slave. As a clock master, the LRCK and SCLK pins are outputs with the left/right and serial clocks synchronously generated on-chip. As a clock slave, the LRCK and SCLK pins are inputs and require the left/right and serial clocks to be externally generated. The selection of clock master or slave is made via the Mode pins as shown in Table 2.

M1 (Pin 16)	M0 (Pin 1)	MODE
0	0	Clock Master, Single-Speed Mode
0	1	Clock Master, Double-Speed Mode
1	0	Clock Master, Quad-Speed Mode
1	1	Clock Slave, All Speed Modes

Table 2. CS5342 Mode Control

4.2.1   Operation as a Clock Master

As a clock master, LRCK and SCLK operate as outputs. The left/right and serial clocks are internally derived from the master clock with the left/right clock equal to Fs and the serial clock equal to 64x Fs, as shown in Figure 18.

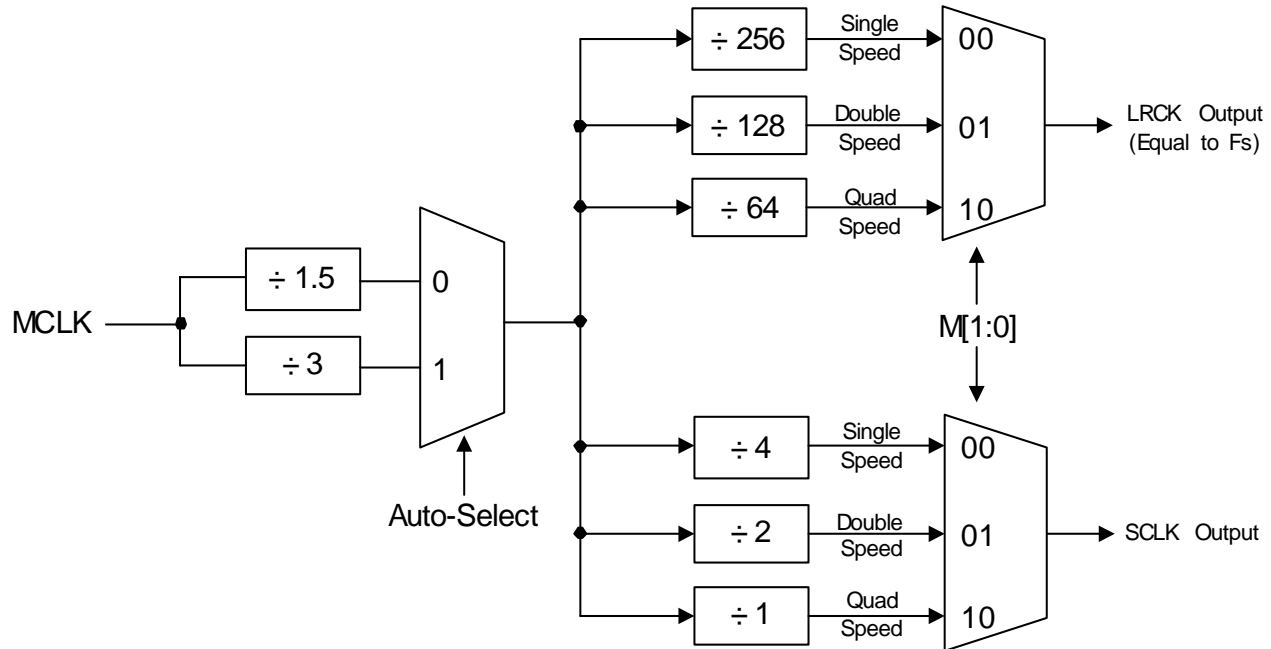

Figure 18. CS5342 Master Mode Clocking

4.2.2   Operation as a Clock Slave

LRCK and SCLK operate as inputs in clock slave mode. It is recommended that the left/right clock be synchronously derived from the master clock and must be equal to Fs. It is also recommended that the serial clock be synchronously derived from the master clock and equal to 48x Fs or 64x Fs in Single-Speed Mode. In Double-Speed and Quad-Speed Modes, the serial clock must be derived synchronously from the master clock and equal to 48x Fs. Additionally, Quad-Speed Slave Mode is only specified for operation with a VA and VD at 5 V, ±5%.

A unique feature of the CS5342 is the automatic selection of either Single-, Double- or Quad-Speed Mode when operating as a clock slave. The auto-mode select feature negates the need to configure the Mode pins to correspond to the desired mode. The auto-mode selection feature supports all standard audio sample rates from 2 to 200 kHz. However, there are ranges of non-standard audio sample rates that are not supported when operating with a fast MCLK (768x, 384x, and 192x for Single-, Double-, and Quad-Speed Modes respectively). Please refer to Table 1 on page 14 for supported sample rate ranges.

4.2.3 Master Clock

The CS5342 requires a Master clock (MCLK) which runs the internal sampling circuits and digital filters. There is also an internal MCLK divider which is automatically activated according to the frequency of the MCLK. Table 3 shows a listing of the external MCLK/LRCK ratios that are required. Table 3 lists some common audio output sample rates and the required MCLK frequency. Please note that not all of the listed sample rates are supported when operating with a fast MCLK (768x, 384x, 192x for Single-, Double-, and Quad-Speed Modes, respectively).

	Single-Speed Mode	**Double-Speed Mode**	**Quad-Speed Mode**
MCLK/LRCK Ratio	384x, 768x	192x, 384x	96x*, 192x
* Quad-Speed, 96x only available in Master Mode.			

SAMPLE RATE (kHz)	MCLK (MHz)
32	12.288
44.1	16.9344
	33.8688
48	18.432
	36.864
64	12.288
88.2	16.9344
	33.8688
96	18.432
	36.864
192	36.864

Table 3. Master Clock (MCLK) Frequencies for Standard Audio Sample Rates

4.3 Serial Audio Interface

The CS5342 supports both I²S and Left-Justified serial audio formats. Upon start-up, the CS5342 will detect the logic level on SDOUT (pin 4). A 10 kΩ pull-up resistor to VL is needed to select I²S format, and a 10 kΩ pull-down resistor to GND is needed to select Left-Justified format. Please see Figures 13 through 16 for more information on the required timing for the two serial audio interface formats.

Figure 19. Left-Justified Serial Audio Interface

Figure 20. I²S Serial Audio Interface

"CS5342_CG"

4.4 Power-Up Sequence

Reliable power-up can be accomplished by keeping the device in reset until the power supplies, clocks and configuration pins are stable. It is also recommended that reset be enabled if the analog or digital supplies drop below the minimum specified operating voltages to prevent power-glitch-related issues.

4.5 Analog Connections

The analog modulator samples the input at 6.144 MHz. The digital filter rejects signals within the stopband of the filter. However, there is no rejection for input signals that are multiples of the input sampling frequency (n × 6.144 MHz), where n=0, 1, 2, ... Figure 21 shows the suggested filter that attenuates any noise energy at 6.144 MHz and provides the optimum source impedance for the modulators. The use of capacitors that have a large voltage coefficient (such as general-purpose ceramics) must be avoided because these can degrade signal linearity.

Figure 21. CS5342 Recommended Analog Input Buffer

4.6 Grounding and Power Supply Decoupling

As with any high-resolution converter, the CS5342 requires careful attention to power supply and grounding arrangements if its potential performance is to be realized. Figure 17 shows the recommended power arrangements, with VA and VL connected to clean supplies. VD, which powers the digital filter, may be run from the system logic supply or powered from the analog supply via a resistor. In this case, no additional devices should be powered from VD. Decoupling capacitors should be as near to the ADC as possible, with the low value ceramic capacitor being the nearest. All signals, especially clocks, should be kept away from the FILT+ and VQ pins in order to avoid unwanted coupling into the modulators. The FILT+ and VQ decoupling capacitors, particularly the 0.1 μF, must be positioned to minimize the electrical path from FILT+ and REF_GND. The CDB5342 evaluation board demonstrates the optimum layout and power supply arrangements. To minimize digital noise, connect the ADC digital outputs only to CMOS inputs.

4.7 Synchronization of Multiple Devices

In systems where multiple ADCs are required, care must be taken to achieve simultaneous sampling. To ensure synchronous sampling, the MCLK and LRCK must be the same for all of the CS5342's in the system.

4.8 Capacitor Size on the Reference Pin (FILT+)

The CS5342 requires an external capacitance on the internal reference voltage pin, FILT+. The size of this decoupling capacitor affects the low frequency distortion performance, as shown in Figure 22, with larger capacitor values used to optimize low frequency distortion performance. The THD+N curves in Figure 22

were measured with VA = VD = VL = 5 V in Single-Speed Master Mode using a 1 kHz input tone of magnitude -1 dB Full-Scale.

Figure 22. CS5342 THD+N versus Frequency

"CS5342_00"

5. PARAMETER DEFINITIONS

Dynamic Range

The ratio of the rms value of the signal to the rms sum of all other spectral components over the specified bandwidth. Dynamic Range is a signal-to-noise ratio measurement over the specified bandwidth made with a -60 dBFS signal. 60 dB is added to resulting measurement to refer the measurement to full-scale. This technique ensures that the distortion components are below the noise level and do not affect the measurement. This measurement technique has been accepted by the Audio Engineering Society, AES17-1991, and the Electronic Industries Association of Japan, EIAJ CP-307. Expressed in decibels.

Total Harmonic Distortion + Noise

The ratio of the rms value of the signal to the rms sum of all other spectral components over the specified bandwidth (typically 10 Hz to 20 kHz), including distortion components. Expressed in decibels. Measured at -1 and -20 dBFS as suggested in AES17-1991 Annex A.

Frequency Response

A measure of the amplitude response variation from 10 Hz to 20 kHz relative to the amplitude response at 1 kHz. Units in decibels.

Interchannel Isolation

A measure of crosstalk between the left and right channels. Measured for each channel at the converter's output with no signal to the input under test and a full-scale signal applied to the other channel. Units in decibels.

Interchannel Gain Mismatch

The gain difference between left and right channels. Units in decibels.

Gain Error

The deviation from the nominal full-scale analog input for a full-scale digital output.

Gain Drift

The change in gain value with temperature. Units in ppm/°C.

Offset Error

The deviation of the mid-scale transition (111...111 to 000...000) from the ideal. Units in mV.
