Functional Description^[1]

The CY62167DV18 is a high performance CMOS static RAM organized as 1M words by 16 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL[®]) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption by 99% when addresses are not toggling. Placing the device into standby mode reduces power

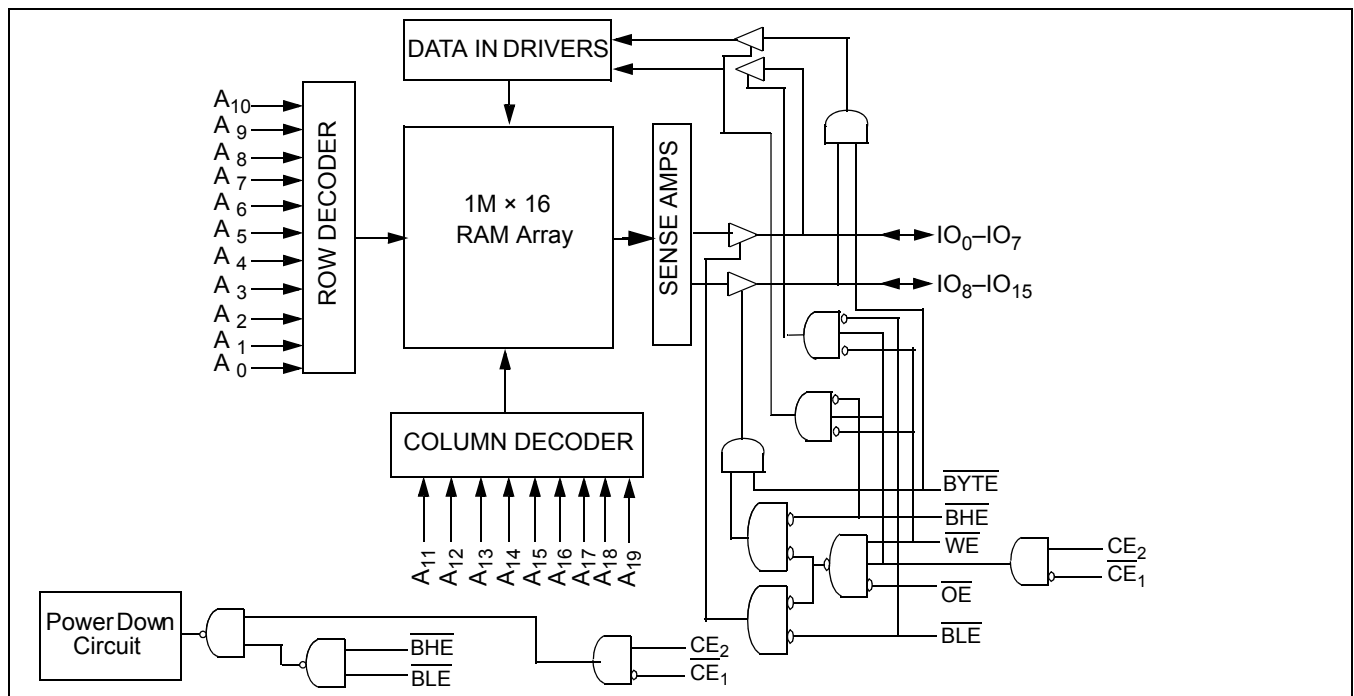

consumption by more than 99% when deselected (\overline{CE}_1 HIGH or CE₂ LOW or both \overline{BHE} and \overline{BLE} are HIGH). The input and output pins (IO₀ through IO₁₅) are placed in a high impedance state when:

- Deselected (\overline{CE}_1 HIGH or CE₂ LOW)
- Outputs are disabled (\overline{OE} HIGH)
- Both Byte High Enable (\overline{BHE}) and Byte Low Enable (\overline{BLE}) are disabled (\overline{BHE} , \overline{BLE} HIGH)
- Write operation is active (\overline{CE}_1 LOW, CE₂ HIGH and \overline{WE} LOW)

To write to the device, take Chip Enables (\overline{CE}_1 LOW and CE₂ HIGH) and Write Enable (\overline{WE}) input LOW. If \overline{BLE} is LOW, then data from IO pins (IO₀ through IO₇) is written into the location specified on the address pins (A₀ through A₁₉). If \overline{BHE} is LOW then data from IO pins (IO₈ through IO₁₅) is written into the location specified on the address pins (A₀ through A₁₉).

To read from the device, take Chip Enables (\overline{CE}_1 LOW and CE₂ HIGH) and \overline{OE} LOW while forcing the \overline{WE} HIGH. If \overline{BLE} is LOW, then data from the memory location specified by the address pins appear on IO₀ to IO₇. If \overline{BHE} is LOW, then data from memory appears on IO₈ to IO₁₅. See the “Truth Table” on page 9 for a complete description of read and write modes.

Notes

10. Test conditions for all parameters other than tri-state parameters assume signal transition time of 1 ns/V, timing reference levels of V_{CC(typ)}/2, input pulse levels of 0 to V_{CC(typ)}, and output loading of the specified I_{OL}/I_{OH} as shown in "AC Test Loads and Waveforms" on page 4.
11. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZBE} is less than t_{LZBE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any given device.
12. t_{HZOE}, t_{HZCE}, t_{HZBE}, and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
13. The internal write time of the memory is defined by the overlap of \overline{WE} , CE₁ = V_{IL}, BHE, BLE or both = V_{IL}, and CE₂ = V_{IH}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

Switching Waveforms

Read Cycle 1 (Address Transition Controlled)^[14, 15]

Read Cycle 2 (\overline{OE} Controlled)^[15, 16]

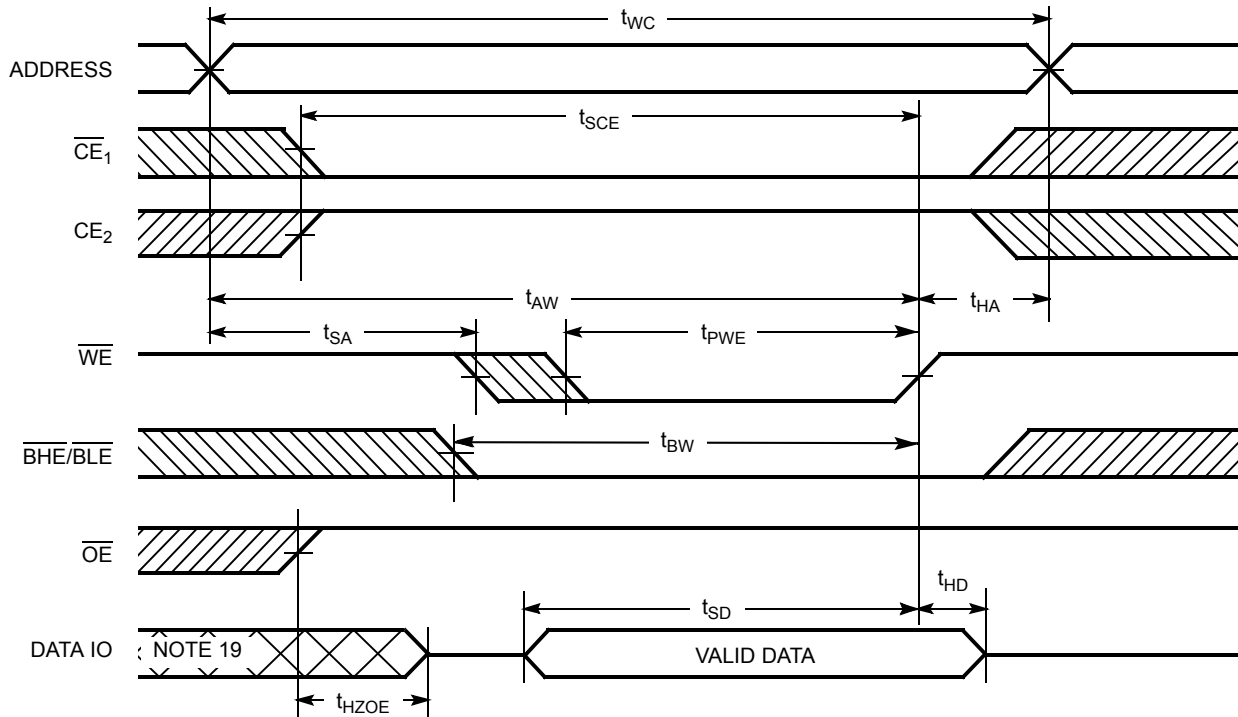

Notes

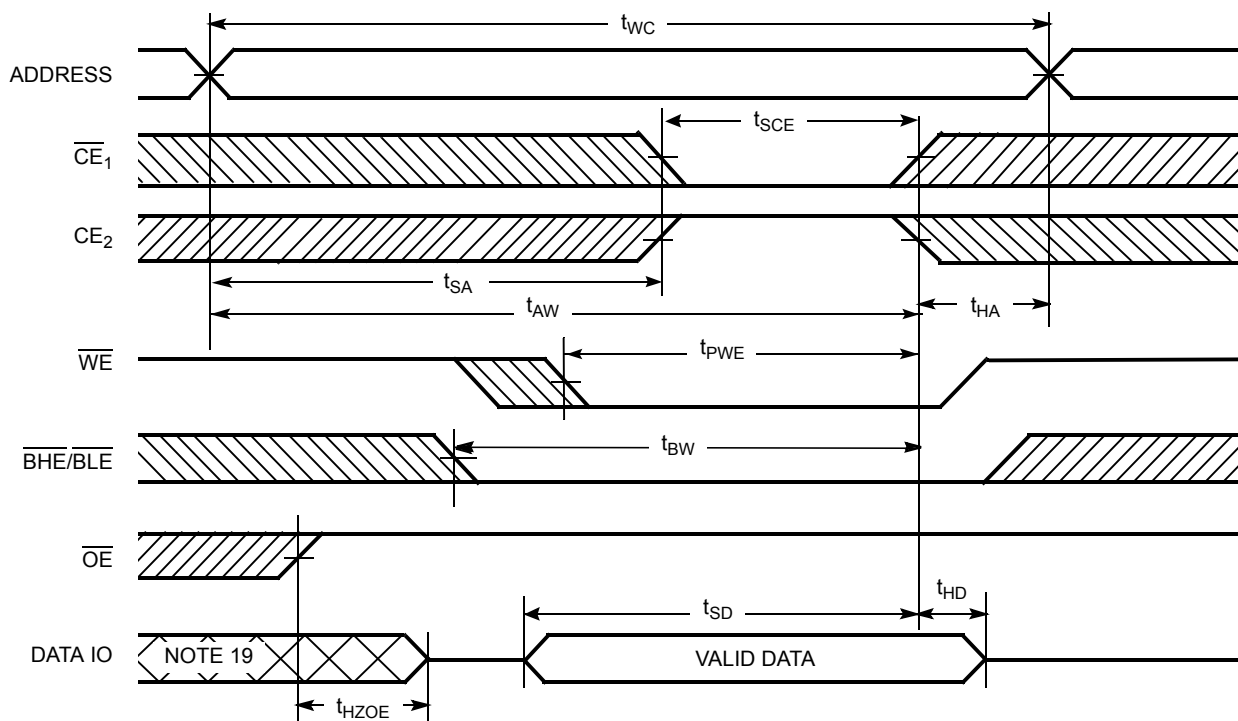

14. The device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$, and $CE_2 = V_{IH}$.
15. \overline{WE} is HIGH for read cycle.
16. Address valid before or similar to \overline{CE}_1 , \overline{BHE} , \overline{BLE} transition LOW and CE_2 transition HIGH.

Switching Waveforms (continued)

Write Cycle 1 (\overline{WE} Controlled)^[13, 17, 18]

Write Cycle 2 (\overline{CE}_1 or CE_2 Controlled)^[13, 17, 18]

Notes

17. Data IO is high impedance if $\overline{OE} = V_{IH}$.

18. If \overline{CE}_1 goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

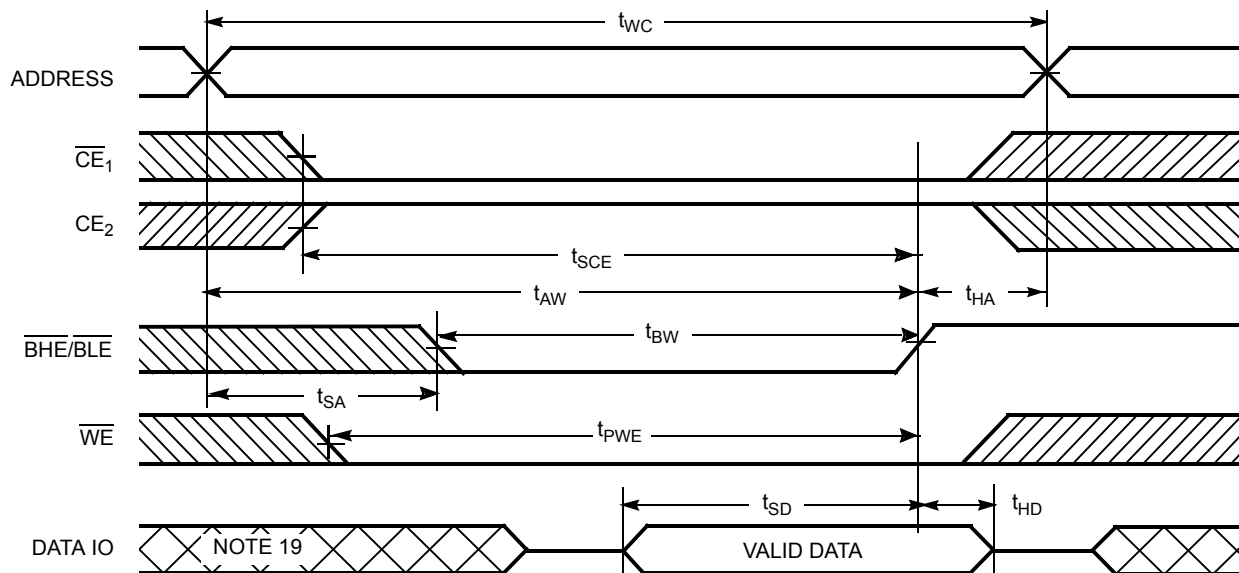

19. During this period, the IOs are in output state. Do not apply input signals.

Switching Waveforms (continued)

Write Cycle 3 (\overline{WE} Controlled, \overline{OE} LOW)^[18]

Write Cycle 4 ($\overline{BHE}/\overline{BLE}$ Controlled, \overline{OE} LOW)^[18]
