

## Low-noise, Programmable Gain, Differential Amplifier

### Features

- Signal Bandwidth: DC to 2 kHz
- Selectable Gain: x1, x2, x4, x8, x16, x32, x64
- Differential Inputs, Differential Outputs
  - Multiplexed inputs: INA, INB, 800Ω termination
  - Rough / fine charge outputs for CS5371/72
  - Max signal amplitude: 5 V<sub>pp</sub> differential
  - Low input bias: 500 pA
- Outstanding Noise Performance
  - 0.20 μV<sub>p-p</sub> between 0.1 Hz and 10 Hz
  - 8.5 nV/√Hz from 0.1 Hz to 2 kHz
- Low Total Harmonic Distortion
  - -118 dB THD typical (0.000126%)
  - -112 dB THD maximum (0.000251%)
- Low Power Consumption
  - Normal/LPWR/PWDN: 5.5 mA, 3.5 mA, 10 μA
- Single or Dual Power Supply Configurations
  - VA+ = +5 V; VA- = 0 V; VD = +3.3 V to +5 V
  - VA+ = +2.5 V; VA- = -2.5 V; VD = +3.3 V

### Description

The CS3301 is a low-noise differential input, differential output amplifier with programmable gain, optimized for amplifying signals from low-impedance sensors such as geophones. The gain settings are binary weighted (x1, x2, x4, x8, x16, x32, x64) and are selected using simple pin settings. Two sets of external inputs, INA and INB, simplify system design as inputs from a sensor and test DAC. An internal 800 Ω termination can also be selected for noise tests.

Amplifier noise performance is outstanding with a noise density of 8.5 nV/√Hz over the 0.1 Hz to 2 kHz bandwidth. Distortion performance is also extremely good, typically -118 dB THD. Flat noise down to 0.1 Hz and low total harmonic distortion make this amplifier ideal for low-frequency, low-amplitude, differential signals requiring maximum dynamic range.

### ORDERING INFORMATION

See [page 15](#).

## 1. CHARACTERISTICS AND SPECIFICATIONS

- Min/Max characteristics and specifications are guaranteed over the Specified Operating Conditions.
- Typical performance characteristics and specifications are derived from measurements taken at nominal supply voltages and  $T_A = 25^\circ\text{C}$ .
- DGND = 0 V, all voltages with respect to 0 V.

### SPECIFIED OPERATING CONDITIONS

| Parameter                      | Symbol           | Min            | Nom  | Max    | Unit |    |
|--------------------------------|------------------|----------------|------|--------|------|----|
| <b>Unipolar Power Supplies</b> |                  |                |      |        |      |    |
| Positive Analog                | VA+              | 4.75           | 5.0  | 5.25   | V    |    |
| Negative Analog (Note 1)       | VA-              | -0.25          | 0    | 0.25   | V    |    |
| Positive Digital (Note 2)      | VD               | 3.135          | 3.3  | 5.25   | V    |    |
| <b>Bipolar Power Supplies</b>  |                  |                |      |        |      |    |
| Positive Analog                | VA+              | 2.375          | 2.5  | 2.625  | V    |    |
| Negative Analog (Note 1)       | VA-              | -2.625         | -2.5 | -2.375 | V    |    |
| Positive Digital (Note 2)      | VD               | 3.135          | 3.3  | 3.465  | V    |    |
| <b>Thermal</b>                 |                  |                |      |        |      |    |
| Ambient Operating Temperature  | Industrial (-IS) | T <sub>A</sub> | -40  | -      | 85   | °C |

- Notes: 1. VA- must be the most negative voltage to avoid potential SCR latch-up conditions.  
2. VD must conform to Digital Supply Differential under Absolute Maximum Ratings.

### ABSOLUTE MAXIMUM RATINGS

| Parameter                                       | Symbol             | Min       | Max       | Parameter        |
|-------------------------------------------------|--------------------|-----------|-----------|------------------|

| Digital Supply Differential [(VD) - (VA-)]      | VD <sub>DIFF</sub> | -         | 6.8       | V                |
| Input Current, Any Pin Except Supplies (Note 3) | I <sub>IN</sub>    | -         | $\pm 10$  | mA               |
| Input Current, Power Supplies (Note 3)          | I <sub>IN</sub>    | -         | $\pm 50$  | mA               |
| Output Current (Note 3)                         | I <sub>OUT</sub>   | -         | $\pm 25$  | mA               |
| Power Dissipation                               | PDN                | -         | 500       | mW               |
| Analog Input Voltages                           | V <sub>INA</sub>   | (VA-)-0.5 | (VA+)+0.5 | V                |
| Digital Input Voltages                          | V <sub>IND</sub>   | -0.5      | (VD)+0.5  | V                |
| Ambient Operating Temperature (Power Applied)   | T <sub>A</sub>     | -40       | 85        | $^\circ\text{C}$ |
| Storage Temperature Range                       | T <sub>STG</sub>   | -65       | 150       | $^\circ\text{C}$ |

WARNING: Operation at or beyond these limits may result in permanent damage to the device.  
Normal operation is not guaranteed at these extremes.

- Notes: 3. Transient currents up to 100 mA will not cause SCR latch-up.

## THERMAL CHARACTERISTICS

| Parameter                                     | Symbol        | Min | Typ | Max | Unit   |

| Linearity                                         | (Note 5, 6)                              | LIN       | -      | 0.000126 | 0.000316 | %              |

- Notes: 4. Guaranteed by design and/or characterization.  
5. Tested with a full scale input signal of 31.25 Hz.  
6. Noise in the harmonic bins dominates THD and linearity measurements for x16, x32, x64 gains.

7. Common mode signals pass through the differential amplifier architecture.
8. Absolute gain accuracy tests the matching of x1 gain across multiple CS3301 devices.
9. Relative gain accuracy tests the tracking of x1,x2,x4,x16,x32,x64 gain relative to x8 gain on a single CS3301 device.
10. Specification is for the parameter over the specified temperature range and is for the CS3301 device only. It does not include the effects of external components.
11. Offset voltage is tested with the amplifier inputs connected to the internal 800Ω termination.
12. The absolute offset after calibration specification applies to the effective offset voltage of the CS3301 output when used with the CS5371/72 modulator and CS5376A digital filter, and is measured from the digitally calibrated output codes of the CS5376A.
13. The CS3301 offset calibration is performed digitally with the CS5371/72 modulator and CS5376A digital filter and includes the full scale signal range. Calibration offsets of greater than ± 5% of full scale will begin to subtract from system dynamic range.

| Load Capacitance                                      | C <sub>L</sub>      | -                      | -      | 100                      | nF                |

Notes: 14. No signals operating from external power supplies should be applied to pins of the device prior to its own supplies being established. Connecting any terminal to voltages greater than VA+ or less than VA- may cause destructive latch-up.

15. Ratio of common mode input amplitude vs. differential mode output amplitude for a perfectly matched common mode input signal. Characterized with a 50 Hz, 500 mV<sub>peak</sub> common mode sine wave applied to the analog inputs.

16. Output impedance characteristics are primarily determined by the integrated anti-alias resistors. Values are approximate and can vary up to +/- 10% depending on process parameters.

- Notes: 19. All outputs unloaded. Analog inputs connected to the internal 800  $\Omega$  termination. Digital inputs forced to VD or DGND respectively.
20. Power supply rejection characterized with a 50 Hz, 400 mVp-p sine wave applied separately to each supply.

## 2. GENERAL DESCRIPTION

The CS3301 is a low-noise chopper-stabilized CMOS differential input, differential output amplifier for precision analog signals between DC and 2 kHz. It has multiplexed inputs, rough/fine charge outputs, and programmable gains of x1, x2, x4, x8, x16, x32, and x64.

The amplifier's performance makes it ideal for low-frequency, high dynamic range applications requiring low distortion and minimal power consumption. It's optimized for use in acquisition systems designed around the CS5371/72 single/dual  $\Delta\Sigma$  modulators and the CS5376A quad digital filter. Figure 3 shows the system architecture of a 4-channel acquisition system using four CS3301, two CS5372, one CS4373A, and one CS5376A.

### 2.1 Analog Signals

#### 2.1.1 Analog Inputs

The amplifier analog inputs are designed for differential sensors. Input multiplexing simplifies system connections by providing separate inputs for a sensor and test DAC (INA, INB) as well as an internal termination for noise tests. The MUX0, MUX1 digital pins determine which multiplexed input is connected to the amplifier.

#### 2.1.2 Analog Outputs

The amplifier analog outputs are separated into rough charge / fine charge signals to easily connect to the CS5371/72 inputs. Each output also includes a series resistor, requiring only two differential capacitors to create the CS5371/72 input anti-alias filter.

Figure 3. Multi-Channel System Architecture

### 2.1.3 Differential Signals

Analog signals into and out of the CS3301 are differential, consisting of two halves with equal but opposite magnitude varying about a common mode voltage.

A full scale 5 V<sub>pp</sub> differential signal centered on a -0.15 V common mode can have:

$$\text{SIG+} = -0.15 \text{ V} + 1.25 \text{ V} = 1.1 \text{ V}$$

$$\text{SIG-} = -0.15 \text{ V} - 1.25 \text{ V} = -1.4 \text{ V}$$

SIG+ is +2.5 V relative to SIG-

For the reverse case:

$$\text{SIG+} = -0.15 \text{ V} - 1.25 \text{ V} = -1.4 \text{ V}$$

$$\text{SIG-} = -0.15 \text{ V} + 1.25 \text{ V} = 1.1 \text{ V}$$

SIG+ is -2.5 V relative to SIG-

The total swing for SIG+ relative to SIG- is (+2.5 V) - (-2.5 V) = 5 V<sub>pp</sub>. A similar calculation can be done for SIG- relative to SIG+. Note that a 5 V<sub>pp</sub> differential signal centered on a -0.15 V common mode voltage never exceeds 1.1 V and never drops below -1.4 V on either half of the signal.

By definition, differential voltages are to be measured with respect to the opposite half, not relative to ground. A multimeter differentially measuring between SIG+ and SIG- in the above example would properly read 1.767 V<sub>rms</sub>, or 5 V<sub>pp</sub>.

## 2.2 Digital Signals

### 2.2.1 Clock Input

The clock signal is used by the chopper-stabilization circuitry of the amplifier analog inputs. The CLK pin can be driven by an external clock source for synchronous operation, or CLK can be grounded to run from its own internally generated clock signal. The CLK pin is connected to a clock detect circuit which will disable the internal clock and use an external clock if one is supplied. If the internal clock signal is to be used, the CLK pin should be connected to DGND.

### 2.2.2 Gain Selection

The CS3301 supports gain ranges of x1, x2, x4, x8, x16, x32, and x64. They are selected using the GAIN0, GAIN1, and GAIN2 pins as shown in Table 1 on page 8.

### 2.2.3 Mux Selection

The analog inputs to the amplifier are multiplexed, with external signals applied to the INA+, INA- or INB+, INB- pins. An internal termination is also available for noise tests. Input mux selection is made using the MUX0 and MUX1 pins as shown in Table 1 on page 8.

Although a mux selection is provided to enable the INA and INB switches simultaneously, significant current should not be driven through them in this mode. The CS3301 mux switches will maintain good linearity only with minimal signal currents.

### 2.2.4 Low Power Selection

For applications where power is critical, a low-power mode can be selected. This mode reduces amplifier power consumption at the expense of slightly degraded performance. Low power mode is selected using the LPWR pin, which is active high.

### 2.2.5 Power Down Selection

A power-down mode is available to shut down the amplifier when not in use. When enabled, all internal circuitry is disabled, the analog inputs and outputs go high-impedance, and the device enters a micro-power state. Power down mode is selected using the PWDN pin, which is active high.

## 2.3 Power Supplies

### 2.3.1 Analog Power Supplies

The analog power pins of the CS3301 are to be supplied with a total of 5 V between VA+ and VA-. This voltage is typically from a bipolar ±2.5 V power supply. When using bipolar power supplies, the analog signal common mode voltage should be biased to 0 V. The analog power supplies are rec-

ommended to be bypassed to system ground using 0.1  $\mu\text{F}$  X7R type capacitors.

The VA- supply is connected to the CMOS substrate and as such must remain the most negative applied voltage to prevent potential latch-up conditions. Care should be taken to ensure analog input voltages do not drop more than -0.3 V below the VA- supply. Care should also be taken to establish the VA- supply before analog signals are applied to the device. It is recommended to clamp the VA-

supply to system ground using a reversed biased Schottky diode to prevent possible latch-up conditions related to mismatched supply rail initialization.

### 2.3.2 *Digital Power Supplies*

The digital power supply across the VD and DGND pins is flexible and can be set to interface with 3.3V or 5V logic. The digital power supply should be bypassed to system ground using a 0.01  $\mu\text{F}$  X7R type capacitor.

Figure 4 shows a connection diagram for the CS3301 amplifier when used with the CS5372 dual  $\Delta\Sigma$  modulator and CS5376A digital filter. The diagram shows differential sensors, a test DAC, and

| <b>DGND</b>                | 15         | I   | Digital ground.                                                                    |
| <b>INA+, INA-</b>          | 5, 6       | I   | Channel A differential analog inputs. Selected via MUX pins.                       |
| <b>INB+, INB-</b>          | 8, 7       | I   | Channel B differential analog inputs. Selected via MUX pins.                       |
| <b>OUTR+, OUTR-</b>        | 11, 2      | O   | Rough charge differential analog outputs.                                          |
| <b>OUTF+, OUTF-</b>        | 10, 3      | O   | Fine charge differential analog outputs.                                           |
| <b>GAIN0, GAIN1, GAIN2</b> | 22, 21, 20 | I   | Gain range select. See Gain Selection table in Digital Characteristics section.    |
| <b>CLK</b>                 | 13         | I   | Master clock input. Connect to DGND to use internal oscillator.                    |
| <b>LPWR</b>                | 18         | I   | Low power mode enable. Active high.                                                |
| <b>PWDN</b>                | 19         | I   | Power down mode enable. Active high.                                               |
| <b>MUX0, MUX1</b>          | 24, 23     | I   | Analog input select. See Input Selection table in Digital Characteristics section. |
| <b>TEST0</b>               | 12         | I   | Test mode select, factory use only. Connect to VA- during normal operation.        |
| <b>TEST1, TEST2</b>        | 17, 14     | I   | Test mode select, factory use only. Connect to DGND during normal operation.       |
| <b>TESTOUT</b>             | 9          | O   | Test mode output, factory use only. Connect to VA- during normal operation.        |

Table 2. Pin Descriptions

#### 4. ORDERING INFORMATION

| Model                  | Temperature   | Package     |
|------------------------|---------------|-------------|
| CS3301-IS              | -40 to +85 °C | 24-pin SSOP |
| CS3301-ISZ (lead free) |               |             |

#### 5. ENVIRONMENTAL, MANUFACTURING, & HANDLING INFORMATION

| Model Number           | Peak Reflow Temp | MSL Rating* | Max Floor Life |
|------------------------|------------------|-------------|----------------|
| CS3301-IS              | 240 °C           | 2           | 365 Days       |
| CS3301-ISZ (lead free) | 260 °C           | 3           | 7 Days         |

\* MSL (Moisture Sensitivity Level) as specified by IPC/JEDEC J-STD-020.

## 6. PACKAGE DIMENSIONS

### 24 PIN SSOP PACKAGE DRAWING

| DIM | INCHES |       | MILLIMETERS |      | NOTE |
|-----|--------|-------|-------------|------|------|
|     | MIN    | MAX   | MIN         | MAX  |      |
| A   | --     | 0.084 | --          | 2.13 |      |
| A1  | 0.002  | 0.010 | 0.05        | 0.25 |      |
| A2  | 0.064  | 0.074 | 1.62        | 1.88 |      |
| b   | 0.009  | 0.015 | 0.22        | 0.38 | 2,3  |
| D   | 0.311  | 0.335 | 7.90        | 8.50 | 1    |
| E   | 0.291  | 0.323 | 7.40        | 8.20 |      |
| E1  | 0.197  | 0.220 | 5.00        | 5.60 | 1    |
| e   | 0.024  | 0.027 | 0.61        | 0.69 |      |
| L   | 0.025  | 0.040 | 0.63        | 1.03 |      |
| ∞   | 0°     | 8°    | 0°          | 8°   |      |

- Notes:
- "D" and "E1" are reference datums and do not include mold flash or protrusions, but do include mold mismatch and are measured at the parting line, mold flash or protrusions shall not exceed 0.20 mm per side.
  - Dimension "b" does not include dambar protrusion/intrusion. Allowable dambar protrusion shall be 0.13 mm total in excess of "b" dimension at maximum material condition. Dambar intrusion shall not reduce dimension "b" by more than 0.07 mm at least material condition.
  - These dimensions apply to the flat section of the lead between 0.10 and 0.25 mm from lead tips.
