

LOW POWER PWM CONTROLLER FOR OFF-LINE BATTERY CHARGER

AP3700E

General Description

The AP3700E is a green-mode pulse width modulation (PWM) controller. It is specially designed for low power applications such as off-line battery chargers, where the needs for low standby power, space saving and low cost are all required. In a battery charger rated 5V/0.8A, the maximum standby power is only 0.18Watt.

In normal operation, the AP3700E switches on and off at a fixed switching frequency of 60 kHz. With a current limit capability of 460mA, the AP3700E can directly drive the emitter of high voltage NPN transistor. When output power falls below a given level, the IC enters skip cycle mode to reduce power consumption.

The AP3700E also features under-voltage lockout, over-current and short circuit protections.

The AP3700E is available in TO-92 package.

Features

- Current Mode Control with Skip Cycle Capability
- Lower Operating Current: 0.45mA
- Fixed Switching Frequency: 60 kHz
- Frequency Dithering for Low EMI: $\pm 2.5\text{kHz}$
- Under-Voltage Lockout Protection
- Over-Current Protection
- Internal Short Circuit Protection
- Higher Output Voltage at OUT Terminal
- Low Total Cost Solution

Applications

- Battery Chargers
- Off-Line Power Supplies

Pin Description

Pin Number	Pin Name	Function
1	VCC	The power supply of the IC, and is generally connected to opto-coupler's emitter
2	GND	Supply ground
3	OUT	The output pin, connected to the emitter of NPN transistor or the source of MOSFET

Ordering Information

Package	Switching Frequency	Temperature Range	Part Number		Marking ID		Packing Type
			Lead Free	Green	Lead Free	Green	
TO-92	60kHz	-40 to 85°C	AP3700EZ-E1	AP3700EZ-G1	3700EZ-E1	3700EZ-G1	Bulk
			AP3700EZTR-E1	AP3700EZTR-G1	3700EZ-E1	3700EZ-G1	Ammo

BCD Semiconductor's Pb-free products, as designated with "E1" suffix in the part number, are RoHS compliant. Products with "G1" suffix are available in green packages.

Absolute Maximum Ratings (Note 1)

Parameter	Value	Unit
Supply Voltage	-0.3 to 6.0	V
Voltage at OUT (Note 2)	-0.3 to 40	V
Output Current at OUT	Internally limited	A
Power Dissipation	0.6	W
Operating Junction Temperature	150	°C
Storage Temperature	-65 to 150	°C
Lead Temperature (Soldering, 10s)	300	°C
ESD (Machine Model)	200	V

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: The Breakdown Voltage. The actual operating voltage can not be greater than the value listed here.

Electrical Characteristics

($V_{CC}=4.5V$, $T_J=25^{\circ}C$, unless otherwise specified.)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
UVLO SECTION						
Start-up Voltage	$V_{TH(ST)}$		5.5	5.75	5.95	V
Minimal Operating Voltage	$V_{OPR(min)}$		3.6	3.8	4.0	V
STANDBY CURRENT SECTION						
Start-up Current (Note 3)	I_{ST}	$V_{CC}=4.5V$		0.22	0.45	mA
Operating Current	$I_{CC(OPR)}$			0.45	0.7	
V_{CC} Zener Voltage	V_Z	$I_{CC}=10mA$	6	6.3		V
Dynamic Impedance	R_{VCC}	$V_{CC}=3.8$ to $4.8V$		18		k Ω
INTERNAL OSCILLATOR						
Switching Frequency	f_{SW}		50	60	75	kHz
Frequency dithering			± 2	± 2.5	± 3	kHz
Temperature Stability		-40 to $85^{\circ}C$		5	10	%
DRIVE OUTPUT SECTION						
OUT Turn-on Voltage	$V_{OUT(ON)}$			9.5	12	V
OUT Turn-off Voltage	$V_{OUT(OFF)}$		5	5.5	6.5	V
Rise Time	T_R	$C_L=1nF$, 15Ω pull-up		60		ns
Fall Time	T_F	$C_L=1nF$, 15Ω pull-up		30		
Maximum Duty Cycle	D_{MAX}	$V_{OPR(min)} + 0.2V$	67	75	84	%
Minimum Duty Cycle				3		
Driver OUT On-Resistance	R_{OUT}	$I_{OUT}=0.06A$		3		Ω
Switch Off Current (OUT)		Driver off, $V_{OUT}=10V$		20	40	μA
Effective Current Limit	I_{LIM}	$V_{CC} = V_{OPR}+0.1V$	460			mA
OUT Current Coefficient	G_A			-0.3		A/V

Note 3: AP3700E is an emitter drive controller, the PWM controller will start up only when the voltage on the OUT pin rises up to its threshold value.

Function Description

1. Startup Circuit

Figure 3 is the functional block diagram of AP3700E, and there are 3 external pins: the VCC pin, the OUT pin and GND pin. In typical application shown by Figure 10, the VCC pin is used for both bias supply and feedback control. The OUT pin directly drives external NPN transistor or MOSFET, and also provides initial bias power for UVLO comparator. When the IC works in PWM mode, the auxiliary winding will supply the V_{CC} enough operating current.

Figure 9 shows the start-up sequence of the V_{CC} and the V_{OUT} .

Figure 9. Start-up Sequence of V_{CC} and V_{OUT}

2. V_{CC} /Feedback Control

An opto-coupler and secondary constant voltage/current controller consists of voltage feedback network. When load is heavy, the voltage on VCC will be lower to enlarge duty cycle; on the contrary, if load drops, the voltage on VCC will rise to reduce duty cycle.

3. Frequency Dithering

Frequency dithering is performed by periodically spreading a single switching frequency into adjacent frequency band, so the peak energy is spread. This technique can improve EMI by reducing both quasi-peak and average EMI emissions.

Figure 10. Frequency Dithering Influences the Switching Cycle

AP3700E has reference switching frequency of 60 kHz, and its frequency deviation is ± 2.5 kHz in period of 2ms. Figure 10 shows the frequency dithering influence to the waveform.

4. Current Limit Control

The AP3700E employs current mode control to improve transient response and voltage stability. In Figure 11, the external inductor current through the OUT pin is converted to a voltage by an internal resistor, and this voltage will participate to control duty cycle and peak inductor current.
