

Silicon Gate CMOS IC

# LC749450NW – Digital RGB Image Processor IC

## Overview

The LC749450NW RGB image processing IC converts interlaced video signals such as NTSC and PAL to progressive scan and adjusts the image quality of that signal. Since the LC749450NW can operate at input clock frequencies up to 27 MHz, it is optimal as a pixel display device IC for high-quality high-resolution images. A high image quality progressive scan signal playback system can be implemented easily by combining the LC749450NW with external memory (two 16M SDRAMs).

## Features

- Accepts 30-bit (4:4:4) YCbCr signals, 20-bit (4:2:2) YCbCr signals, and 10-bit RT.656 signals as inputs.
- Supports digital TV inputs (480i, 480p, 1080i, and 720p): 30-bit YCbCr digital signal input.
- 30-bit digital RGB signal inputs
- Produces 30-bit and 24-bit digital RGB (or YCbCr) signal outputs
- Provides both YCbCr/YPbPr → RGB conversion and RGB → YCbCr conversion
- Motion adaptive jagggy-less interlaced to progressive conversion
- 3:2 pull down
- Multiple noise reduction systems (1D, 2D, and 3D)
- Cross color and cross luminance cancellers
- Horizontal outline correction (LTI and CTI)
- Sharpness (horizontal and vertical)
- Sharpness adjuster (shading relief enhancement)
- White and black level expansion, white text correction (blue stretch)
- Flesh tone correction
- Hue and color gain adjustments
- Color exciter (6-phase RGBYMC independent saturation adjustment)
- Brightness and contrast adjustment
- White balance and black balance adjustment
- Gamma correction (Independent RGB, programmable LUT system)
- Dithering (10-bit and 8-bit)
- Clamp control
- Aspect ratio conversion (4:3 → 16:9)
- Clock generator (PLL) circuit
- SDRAM interface
- I<sup>2</sup>C bus and CPU interface circuits

SDPIC™: SANYO Digital Picture Improvement Core

SDPIC™ is a registered trademark of SANYO Electric Co., Ltd.

- Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.
- SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

## Package Dimensions

unit : mm

3261

## IC Specifications

- Supply voltage: Core block: 1.8 V, I/O blocks: 3.3 V
- Maximum operating frequency: 27 MHz (IP conversion mode), 135 MHz (IP conversion not used)
- Package: 208-pin SQFP

## Main Applications

- LCD TVs, monitors, and projectors
- PDP TVs and progressive scan TVs
- DVD players and recorders

## Functional Overview

### 1. Input signal formats

The digital data port supports the following input signal formats.

30-bit RGB

30-bit (4:4:4) YCbCr/YPbPr

20-bit (4:2:2) YCbCr/YPbPr

10-bit signals conforming to the ITU-R BT.656 standard (horizontal and vertical sync inputs required)

NTSC (480i/480p), PAL (576i/576p), and HD (1080i/720p)

RGB (up to 135 MHz)

### 2. IP conversion block

For NTSC (480i) and PAL (576i) inputs the LC749450NW provides motion adaptive IP conversion or cinema IP conversion (3:2 pull down) with both 2D/3D noise reduction and cross color/cross luminance cancellation. External SDRAM (either 2 × 16 Mbits or 1 × 64 Mbits) is required when the functions of this block are enabled. This block is set to bypass mode for 480p, 576p, 1080i, 720p, and PC (RGB) inputs.

#### (1) Motion adaptive IP conversion

The LC749450NW performs motion detection for each pixel that enters the IP conversion block. Based on that result, the block performs interlaced to progressive conversion. Pixels that are found to be static are interpolated between fields and pixels that are found to be moving are interpolated within the field.

Since this circuit takes correlations in the diagonal directions into account when performing inter-field interpolation for moving sections of the image, it can create smooth video with minimal stair-stepping artifacts (jaggies). Furthermore, this function can handle images that range from relaxed smooth video to video with violent motion by setting parameters and changing the motion threshold values for each pixel.

Continued on next page.

(2) Cinema mode IP conversion (3:2 pull down)

When an NTSC interlaced signal that was generated by a film (cinema) source is input, it automatically recognizes the signal as a cinema source and performs cinema mode IP conversion that is optimal for cinema sources.

The threshold value for that recognition can be set with a parameter.

(3) Noise reduction (2D, 3D)

The LC749450NW provides three noise reduction functions: 3D noise reduction, which reduces noise between fields, 2D noise reduction, which reduces noise within the field, and 1D noise reduction, which reduces noise in the scan line direction. This block contains the 3D and 2D noise reduction functions and can operate independently for both the luminance signal and the chrominance signal.

(4) Cross color and cross luminance canceller

This circuit can reduce the cross color noise (rainbow-like color smearing) and cross luminance (dot) noise that is generated when a decoder (such as a 3-line decoder) other than 3D YC separator decoder is used for NTSC input.

This function makes it possible to produce clear and vivid video with no color blotting and no dot interference.

3. Image quality adjustment block

The LC749450NW provides a full complement of image quality adjustment functions and can perform the image quality adjustments required for optimal flat panel TV display.

(1) Horizontal outline correction (LTI/CTI)

The LTI/CTI block applies outline correction to the input signal. The apparent sharpness in the video image is enhanced by increasing the slope of the input signal. Since this function does not add overshoot or undershoot to edges in the video signal, it creates natural-looking images. This function operates independently on the luminance and chrominance signals.

(2) Sharpness (horizontal and vertical)

The sharpness function can correct the outlines in the input signal. This function differs from the LTI/CTI function described above in that it adds an appropriate peak in the corrected outline area. The amount of this peak and a coring level that prevents fine noise from being aggravated can be set in the control registers for this circuit. This function only operates on the luminance signal.

(3) Shadow adjuster

The shadow adjuster function detects the outlines in the input signal and adds an appropriate peak before and after the outline to add an appearance of a shadow. This creates a video signal that is varied and not dull.

(4) White and black expansion

The white and black expansion function adaptively expands the white and black levels in the Y component of the YCbCr signal using the white and black peak levels in the immediately preceding field, the luminance signal average picture level (APL), distributional information, and microcontroller settings. The white and black peaks are the maximum and minimum values in the input data within a single field. When the white and black expansion function is used, the values of the settings must be set appropriately.

(5) White text correction (blue stretch)

The blue stretch function creates visually pleasing white text by adding a small amount of blue to white characters. A gain adjustment is applied to section of the Y signal recognized as white text and added to the Cb signal.

(6) Flesh tone correction

The flesh tone correction function extracts just the set skin color without affecting other colors and allows just that color to be adjusted.

(7) Hues and color gain adjustment

The hue adjustment adjusts the hue of the whole image. The color gain adjustment adjusts the depth of the color by controlling the gain applied to the color difference signals. This function can adjust the Cb and Cr signals independently.

## [查询"LC749450NW"供应商](#)

The color exciter can independently control the red, green, blue, magenta, yellow, and cyan colors.

### (9) Brightness and contrast controls

The brightness control adjusts the brightness of the screen as a whole and the contrast control adjusts the gain applied to the brightness.

### (10) White balance and black balance adjustments

These adjust the appearance of white and black on the LCD panel.

### (11) Gamma correction

This function allows the creation of arbitrary gamma curves to match the characteristics of the LCD panel used. The RGB channels can be adjusted independently, using internal programmable LUT.

### (12) Dithering

The LC749450NW performs internal signal processing with a 10-bit precision. When these signals are output as 8-bit values, the lower two bits are rounded by dithering.

## 4. Outputs and Other Functions

### (1) Matrix conversion

The LC749450NW provides the following matrix conversion functions.

YCbCr → RGB

YPbPr → RGB

YPbPr → YCbCr

RGB → YCbCr

### (2) Aspect ratio conversion

An input Rec.601 signal (example: 720 × 240) can be expanded in the horizontal direction and displayed on a WVGA panel.

### (3) Output formats

The LC749450NW can output video in the following formats.

Digital RGB (30 or 24 bits)

Digital YCbCr (30 or 24 bits)

### (4) Clamp control

The LC749450NW can generate the clamp signals required for the front-end A/D converter. It can also generate arbitrary pulses (high, low, or high impedance) by comparing with an IC internal threshold value (that can be set with a register setting).

### (5) SDRAM interface

The LC749450NW includes an SDRAM interface that can directly connect either:

Two 16 Mbit SDRAMs (512 words × 16 bits × 2 banks)

or

One 64 Mbit SDRAM (512 words × 32 bits × 4 banks).

This allows end product systems to be constructed easily.

SDRAMs with a speed grade of 70 or better must be used.

### (6) I<sup>2</sup>C bus interface and CPU interface

The LC749450NW is basically designed to be controlled by setting internal registers over the I<sup>2</sup>C bus.

The slave address can be switched to match the system by controlling pin 85 (SLADR).

The following slave addresses are supported.

SLADR = low: E0h

SLADR = high: E2h

Certain registers can also be controlled over the CPU interface.

## I/O Specifications

### Input Signals

Signal type	Number of pins	Symbol	Description	Notes
Video signals	10	YIN	Y or G	NTSC/PAL/DTV (480I, 480P, 1080I) or progressive scan RGB (up to SXGA) or NTSC/PAL decoder input
	10	CBI	Cb or B or C	
	10	CRI	Cr or R or OSD	
Sync signals	1	DHS	Horizontal sync signal	Pixel sync horizontal sync signal input The polarity can be switched by setting the DVPOLIN internal register.
	1	DVS	Vertical sync signal	Vertical sync signal input The polarity can be switched by setting the DVPOLIN internal register.
Data enable signals	1	DEHI	Data enable	Valid video period enable signal (horizontal/composite)
	1	DEVI	Vertical data enable	Valid video period enable signal (vertical)
	1	FIELD	Field signal input	Field signal input
Pixel clock	1	CLKI	Clock	System clock input
Fixed oscillator	1	DCLKI	Used for the output dot clock	System clock input
	1	XTAL		Fixed clock input or test clock input
System reset	1	XRST	System reset	System reset input, active low
Total	40	—	—	—

### Output Signals

Signal type	Number of pins	Symbol	Description	Notes
Video signals	10	ODG	G	RGB output The LC749450NW also supports dithered 8-bit output.
	10	ODB	B	
	10	ODR	R	
Sync signals	1	DHO	Horizontal sync signal	This pin outputs the DHS pin input after a delay. (Used for pixel sync.) (This can be set over the I <sup>2</sup> C bus.)
	1	DVO	Vertical sync signal	Outputs a vertical pixel sync signal.
Data enable signals	1	AREA	Data enable	Outputs a valid area signal.
Pixel clocks	1	CLKOUT	Outputs the input clock	The polarity can be inverted.
Clamp pulse signals	1	CLAMPO	For A/D conversion	Outputs a pulse signal used for A/D conversion clamp period verification
Clamp levels	1	CLPG	Y/G clamp level	Clamp level discrimination output (Too large: low, too small: high, match: high-impedance)
	1	CLPB	Cb/B clamp level	
	1	CLPR	Cr/R clamp level	
Field discrimination signals	1	ODEVPP0	Field discrimination	Outputs an odd/even field discrimination signal (Used when IP conversion is not used.)
Total	39	—	—	—

### Control Signals

Signal type	Number of pins	Symbol	Description	Notes
I <sup>2</sup> C bus signals	1	SDAIO	Data bus	Used for setting internal registers and reading out the internal status. The slave address is "1110000+(R/W)".
	1	SCLI	Bus clock	
	1	SLADR	Slave switching	
Data output signals	1	OE		Data output enable signal
XTAL	1	XTALSW		This signal sets the XTAL clock pin input operation High: The XTAL clock input signal is divided by 2.
Total	5	—	—	—

## Pin Circuits

I/O type	Function	Applicable pins	Equivalent circuit
PHIC	5 V input	CLKI, DCLKI, XTALI, SDCLKI	
PHIS	5 V Schmitt input	XRST	
PHICD	5 V pull-down resistor input	YIN0 to 9, CBI0 to 9, CRI0 to 9, GP_ADR0 to 7, DEHI, DEVI, DHS, DVS, FIELD, GP_CS, GP_WR, GP_MOD, TSTI0, TSTI1, TSTI4	
PHISD	5 V pull-down resistor Schmitt input	XTAL_SW, SCLI, SLADR, OE, CPU_TST_SW, TSTI2, TSTI3, TSTI5	
PHOT08	8 mA 3-state drive output	ODR0 to 9, ODG0 to 9, ODB0 to 9, DHO, DVO, ODEVFFO, CLAMPOO, AREAO, TSTO1 to 4	
POT08	8 mA 3-state drive output	CLPB, CLPG, CLPR	
PHOT12	12 mA 3-state drive output	CLKOUT, SAD0 to 10, SDCLKO, SDRAS, SDCAS, SDWE, SDDQM, SDBS, TSTO0	
PHBT08	8 mA 3-state drive I/O	GP_IO0 to 7	
PHBT12	12 mA 3-state drive I/O	SDQ0 to 29, SDAIO

## Input and Output Data Timing

### (1) Input Data Timing 1

Parameter	Symbol	Pins	min	max	Unit
Clock low-level time	$t_{LO}$	CLKI	3.70	—	ns
Clock high-level time	$t_{HI}$		3.70	—	ns
Clock period	$t_{CK}$		7.40	—	ns
Input data setup time	$t_{SU}$	YIN [9:0], CBI [9:0], CRI [9:0],	2.5	—	ns
Input data hold time	$t_{HD}$	DHS, DVS, DEHI, DEVI, FIELD	0.5	—	ns

\*: We recommend a duty of 50% for the input clock.

### (2) Input Data Timing 2

Parameter	Symbol	Pins	min	max	Unit
Clock low-level time	$t_{LO}$	SDCLKI	3.70	—	ns
Clock high-level time	$t_{HI}$		3.70	—	ns
Clock period	$t_{CK}$		7.40	—	ns
Input data setup time	$t_{SU}$	SDRAS, SDCAS, SDWE, SAD [10:0],	2	—	ns
Input data hold time	$t_{HD}$	SDBS, SDQ [29:0]	1	—	ns

[查询"LC749450NW"供应商](#)

Parameter	Symbol	Pins	min	max	Unit
Clock low-level time	$t_{LO}$	CLKOUT	3.70	—	ns
Clock high-level time	$t_{HI}$		3.70	—	ns
Clock period	$t_{CK}$		7.40	—	ns
Output data delay time	$t_{AC}$	ODR [9:0], ODG [9:0], ODB [9:0], DHO,	-1.5	1.5	ns
Input data hold time	$t_{HD}$	DVO, AREA	5.90	—	ns

## (4) Output Data Timing 2

Parameter	Symbol	Pins	min	max	Unit
Clock low-level time	$t_{LO}$	SDCLKO	3.70	—	ns
Clock high-level time	$t_{HI}$		3.70	—	ns
Clock period	$t_{CK}$		7.40	—	ns
Output data delay time	$t_{AC}$	SDQ [29:0]	-1.0	1.0	ns
Input data hold time	$t_{HD}$		4	—	ns

## Application Circuit Example

- Specifications of any and all SANYO products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.
- SANYO Electric Co., Ltd. strives to supply high-quality high-reliability products. However, any and all semiconductor products fail with some probability. It is possible that these probabilistic failures could give rise to accidents or events that could endanger human lives, that could give rise to smoke or fire, or that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO products(including technical data, services) described or contained herein are controlled under any of applicable local export control laws and regulations, such products must not be exported without obtaining the export license from the authorities concerned in accordance with the above law.
- No part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, or any information storage or retrieval system, or otherwise, without the prior written permission of SANYO Electric Co., Ltd.
- Any and all information described or contained herein are subject to change without notice due to product/technology improvement, etc. When designing equipment, refer to the "Delivery Specification" for the SANYO product that you intend to use.
- Information (including circuit diagrams and circuit parameters) herein is for example only ; it is not guaranteed for volume production. SANYO believes information herein is accurate and reliable, but no guarantees are made or implied regarding its use or any infringements of intellectual property rights or other rights of third parties.

This catalog provides information as of July, 2005. Specifications and information herein are subject to change without notice.
