

## OVERVIEW

The SM5847AF is a 4/8-times oversampling (interpolation), 2-channel, linear-phase FIR, multi-function digital filter for digital audio reproduction equipment. It features independent left and right-channel digital deemphasis filters and soft muting function.

The input/output interface supports input data in 16/18/20/24-bit words, and output data in 18/20/22/24-bit words in either 4-times or 8-times oversampling selectable output mode.

The internal system clock operates at either 192fs or 256fs selectable speed (where fs is the audio sampling frequency). Plus, the divide-by 1, 2, or 4 counter settings means that external clocks of 768fs/384fs/192fs (192fs input) and 1024fs/512fs/256fs (256fs input) are supported.

The SM5847AF operates from a single 3 to 5 V supply, and is available in 44-pin QFP packages.

## FEATURES

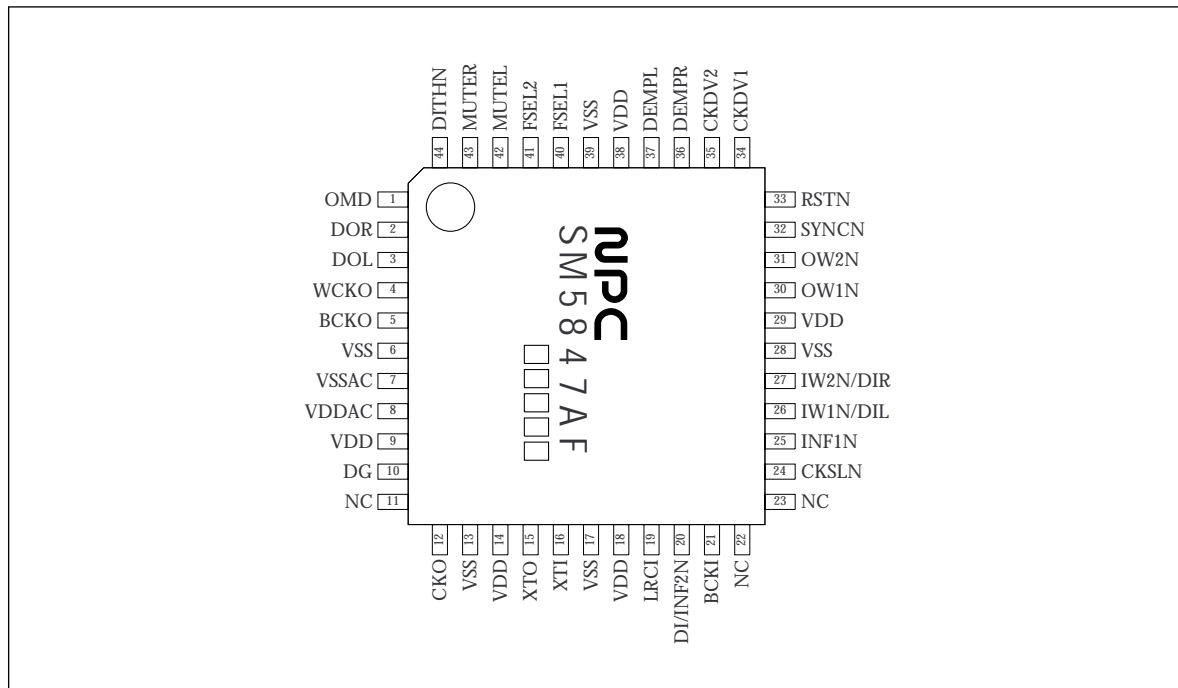

- Left/right-channel (2-channel processing)
- 4-times/8-times oversampling (interpolation)
  - 8-times interpolation filter
    - 3-stage linear-phase FIR configuration
    - 1st stage (fs to 2fs): 169-tap
    - 2nd stage (2fs to 4fs): 29-tap
    - 3rd stage (4fs to 8fs): 17-tap
    - $\leq \pm 0.00002$  dB passband ripple (0 to 0.4535fs)
    - $\geq 117$  dB stopband attenuation (0.5465fs to 7.4535fs)
  - 4-times interpolation filter
    - 2-stage linear-phase FIR configuration
    - 1st stage (fs to 2fs): 169-tap
    - 2nd stage (2fs to 4fs): 29-tap
    - $\leq \pm 0.00002$  dB passband ripple (0 to 0.4535fs)
    - $\geq 116$  dB stopband attenuation (0.5465fs to 3.4535fs)
- Digital deemphasis
  - IIR filter configuration
  - fs = 32kHz, 44.1kHz, 48kHz
  - 2-channel independent ON/OFF control
- $26 \times 24$ -bit parallel multiplier/32-bit accumulator
- Overflow limiter
- Soft muting
  - 2-channel independent ON/OFF control
- Input data format
  - 2s complement, MSB first
  - 3 selectable formats
    - LR alternating, 16/18/20/24-bit serial, right-justified data
    - LR alternating, 24-bit serial, left-justified data
    - LR simultaneous, 24-bit serial, left-justified data
- Output data format
  - 2s complement, MSB first, LR simultaneous
  - 18/20/22/24-bit serial
  - BCKO burst (NPC format)
- Dither round-off processing
  - Dither round-off ON/OFF selectable
- 25-bit internal data word length
- Internal system clock
  - 192fs/256fs selectable
  - Maximum operating frequency
    - 192fs mode: 37 MHz max (5 V)
    - 20.7 MHz max (3 V)
    - 256fs mode: 27.6 MHz max (5 V)
    - 25 MHz max (3 V)
- Jitter-free function
  - Jitter-free/Sync mode selectable
- Crystal oscillator circuit built-in
- 3 to 5 V supply
- 44-pin plastic QFP
- CMOS process

## PIN DESCRIPTION

Number	Name	I/O	Description
1	OMD	I <sup>1</sup>	Output data rate (4fs/8fs) select pin
2	DOR	O <sup>2</sup>	Right-channel data output
3	DOL	O <sup>2</sup>	Left-channel data output
4	WCKO	O <sup>2</sup>	Word clock output
5	BCKO	O <sup>2</sup>	Bit clock output
6	VSS	-	Ground
7	VSSAC	-	Ground
8	VDDAC	-	Supply voltage
9	VDD	-	Supply voltage
10	DG	O <sup>2</sup>	Deglinted signal output
11	NC	-	No internal connection (must be open)
12	CKO	O <sup>2</sup>	Master clock output
13	VSS	-	Ground
14	VDD	-	Supply voltage
15	XTO	O	Oscillator output
16	XTI	I	Oscillator input/master clock input
17	VSS	-	Ground
18	VDD	-	Supply voltage
19	LRCI	I <sup>1</sup>	Input data sample rate (fs) clock input
20	DI/INF2N	I <sup>1</sup>	Data input/input format select pin 2
21	BCKI	I <sup>1</sup>	Bit clock input
22	NC	-	No internal connection (must be open)
23	NC	-	No internal connection (must be open)
24	CKSLN	I <sup>2</sup>	Master clock frequency (192fs/256fs) select pin
25	INF1N	I <sup>2</sup>	Input format select pin 1
26	IW1N/DIL	I <sup>1</sup>	Input data word length select pin 1/left-channel data input
27	IW2N/DIR	I <sup>1</sup>	Input data word length select pin 2/right-channel data input
28	VSS	-	Ground
29	VDD	-	Supply voltage
30	OW1N	I <sup>2</sup>	Output data word length select pin 1
31	OW2N	I <sup>2</sup>	Output data word length select pin 2
32	SYNCN	I <sup>2</sup>	Sync mode select pin
33	RSTN	I <sup>1</sup>	Reset input
34	CKDV1	I <sup>1</sup>	Internal system clock frequency divider set pin 1
35	CKDV2	I <sup>1</sup>	Internal system clock frequency divider set pin 2
36	DEMPR	I <sup>1</sup>	Right-channel deemphasis ON/OFF pin
37	DEMP L	I <sup>1</sup>	Left-channel deemphasis ON/OFF pin
38	VDD	-	Supply voltage
39	VSS	-	Ground
40	FSEL1	I <sup>1</sup>	Deemphasis filter sample rate (fs) select pin 1
41	FSEL2	I <sup>1</sup>	Deemphasis filter sample rate (fs) select pin 2
42	MUTEL	I <sup>1</sup>	Left-channel mute ON/OFF pin
43	MUTER	I <sup>1</sup>	Right-channel mute ON/OFF pin
44	DITHN	I <sup>1</sup>	Output data dither ON/OFF pin

1. Schmitt input, TTL level

2. TTL level

## SPECIFICATIONS

### Absolute Maximum Ratings

$$V_{SS} = V_{SSAC} = 0 \text{ V}, V_{DD} = V_{DDAC}$$

Parameter	Symbol	Condition	Rating	Unit
Supply voltage range <sup>1</sup>	$V_{DD}, V_{DDAC}$		-0.3 to 6.5	V
Input voltage range	$V_I$		$V_{SS} - 0.3$ to $V_{DD} + 0.3$	V
Storage temperature range	$T_{stg}$		-55 to 125	°C
Power dissipation	$P_D$	$\leq 70$ °C	900	mW
		$\leq 85$ °C	700	

1. Supply lines for VDD and VDDAC, and ground lines for VSS and VSSAC, should be connected on the printed circuit board to prevent device breakdown due to potential difference when the power is applied.

### Recommended Operating Conditions

$$V_{SS} = V_{SSAC} = 0 \text{ V}, V_{DD} = V_{DDAC}$$

Parameter	Symbol	Rating	Unit
Supply voltage range <sup>1</sup>	$V_{DD}, V_{DDAC}$	3.00 to 5.25	V
Operating temperature range	$T_a$	-40 to 85	°C

1. The minimum required operating voltage and consequent operating temperature vary with the maximum operating frequency and sampling mode selected, as shown in the following table.

$$V_{SS} = V_{SSAC} = 0 \text{ V}, V_{DD} = V_{DDAC}$$

Sampling frequency $f_s$ (kHz)	Internal system clock		Minimum supply voltage $V_{DD}, V_{DDAC}$ (V)	Operating temperature $T_a$ (°C)
	Mode <sup>1</sup>	Maximum operating frequency (MHz)		
192	192fs	37	4.75 (5.0 – 5%)	-40 to 70
	256fs	Not guaranteed	Not guaranteed	Not guaranteed
108 <sup>2</sup>	192fs	20.7	3.00 (3.3 – 10%)	-40 to 85
	256fs	27.6	4.50 (5.0 – 10%)	
96	192fs	18.5	3.00 (3.3 – 10%)	
	256fs	25	3.00 (3.3 – 10%)	
55.2 <sup>3</sup>	192fs	10.6	3.00 (3.3 – 10%)	
	256fs	14.2	3.00 (3.3 – 10%)	

1. Mode with internal frequency divider ratio set to 1 (CKDV1 = CKDV2 = LOW).  
 2. 96 kHz + 12.5% variable pitch  
 3. 48 kHz + 15% variable pitch

### DC Electrical Characteristics

$V_{DD} = V_{DDAC} = 3.00$  to  $5.25$  V,  $V_{SS} = V_{SSAC} = 0$  V,  $T_a = -40$  to  $85$  °C

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
HIGH-level input voltage <sup>1</sup>	$V_{IH1}$		$0.7V_{DD}$	-	-	V
HIGH-level input voltage <sup>2,4</sup>	$V_{IH2}$		2.0	-	-	V
HIGH-level input voltage <sup>3</sup>	$V_{IH3}$	$V_{DD} = V_{DDAC} = 4.75$ to $5.25$ V	2.4	-	-	V
		$V_{DD} = V_{DDAC} = 3.00$ to $4.75$ V	2.0	-	-	
LOW-level input voltage <sup>1</sup>	$V_{IL1}$	$V_{DD} = V_{DDAC} = 4.75$ to $5.25$ V	-	-	$0.3V_{DD}$	V
		$V_{DD} = V_{DDAC} = 3.00$ to $4.75$ V	-	-	$0.2V_{DD}$	
LOW-level input voltage <sup>2,4</sup>	$V_{IL2}$	$V_{DD} = V_{DDAC} = 4.75$ to $5.25$ V	-	-	0.8	V
		$V_{DD} = V_{DDAC} = 3.00$ to $4.75$ V	-	-	$0.2V_{DD}$	
LOW-level input voltage <sup>3</sup>	$V_{IL3}$	$V_{DD} = V_{DDAC} = 4.75$ to $5.25$ V	-	-	0.8	V
		$V_{DD} = V_{DDAC} = 3.00$ to $4.75$ V	-	-	$0.2V_{DD}$	
Input leakage current <sup>1,2</sup>	$I_{IL1}$	$V_{IN} = 0$ to $5.25$ V	-10	-	10	μA
Input current <sup>3,4</sup>	$I_{IL2}$	$V_{IN} = 0$ V	-10	-50	-120	μA
HIGH-level output voltage <sup>5</sup>	$V_{OH}$	$I_{OH} = -4$ mA	2.4	-	-	V
LOW-level output voltage <sup>5</sup>	$V_{OL}$	$I_{OL} = 4$ mA	-	-	0.4	V

1. Pin XTI

2. Pins LRC1, DI/INF2N, BCKI

3. Pins IW1N/DIL, IW2N/DIR

4. Pins OMD, CKSLN, INF1N, OW1N, OW2N, SYNCN, RSTN, CKDV1, CKDV2, DEMPR, DEMPL, FSEL1, FSEL2, MUTEL, MUTER, DITHN

5. Pins DOR, DOL, WCKO, BCKO, DG, CKO

$V_{DD} = V_{DDAC} = 4.75$  to  $5.25$  V,  $V_{SS} = V_{SSAC} = 0$  V,  $T_a = -40$  to  $85$  °C, XTI = external input, no output load

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
Current consumption	$I_{DD1}$	192fs, XTI = 27 ns (37 MHz), fs = 192 kHz, $T_a = -40$ to $70$ °C	-	-	166	mA
	$I_{DD2}$	256fs, XTI = 40 ns (25 MHz), fs = 96 kHz	-	-	115	mA
	$I_{DD3}$	384fs, XTI = 27 ns (37 MHz), fs = 96 kHz, estimated value	-	-	105	mA
	$I_{DD4}$	192fs, XTI = 54 ns (18.5 MHz), fs = 96 kHz, estimated value	-	-	95	mA
	$I_{DD5}$	384fs, XTI = 54 ns (18.5 MHz), fs = 48 kHz, estimated value	-	-	65	mA

$V_{DD} = V_{DDAC} = 3.00$  to  $3.60$  V,  $V_{SS} = V_{SSAC} = 0$  V,  $T_a = -40$  to  $85$  °C, XTI = external input, no output load

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
Current consumption	$I_{DD6}$	256fs, XTI = 81 ns (12.3 MHz), fs = 48 kHz, estimated value	-	-	27	mA
	$I_{DD7}$	384fs, XTI = 54 ns (18.5 MHz), fs = 48 kHz, estimated value	-	-	28	mA

## AC Electrical Characteristics

### Crystal oscillator (XTI, XTO)

$V_{DD} = V_{DDAC} = 3.00$  to  $5.25$  V,  $V_{SS} = V_{SSAC} = 0$  V,  $T_a = -40$  to  $85$  °C

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
Oscillator frequency <sup>1</sup>	$f_{OSC}$		-	-	50	MHz

1. External circuit components should be matched for the crystal oscillator element used.

### External clock input (XTI)

$V_{DD} = V_{DDAC} = 3.00$  to  $5.25$  V,  $V_{SS} = V_{SSAC} = 0$  V,  $T_a = -40$  to  $85$  °C

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
Master clock frequency	$f_{XTI}$		-	-	60	MHz
Master clock duty		$1/2V_{DD}$ thresholds	40	-	60	%

### Internal system clock

The crystal oscillator frequency or external clock input master clock frequency ratings are described in the preceding tables, but it is the internal system clock frequency rating, set by the internal frequency divider (CKDV1, CKDV2), that must be satisfied. The master clock frequency is a multiple of the sampling frequency  $f_s$ .

CKDV1 = CKDV2 = LOW (internal system clock frequency = XTI input frequency),

$V_{SS} = V_{SSAC} = 0$  V,  $T_a = -40$  to  $85$  °C

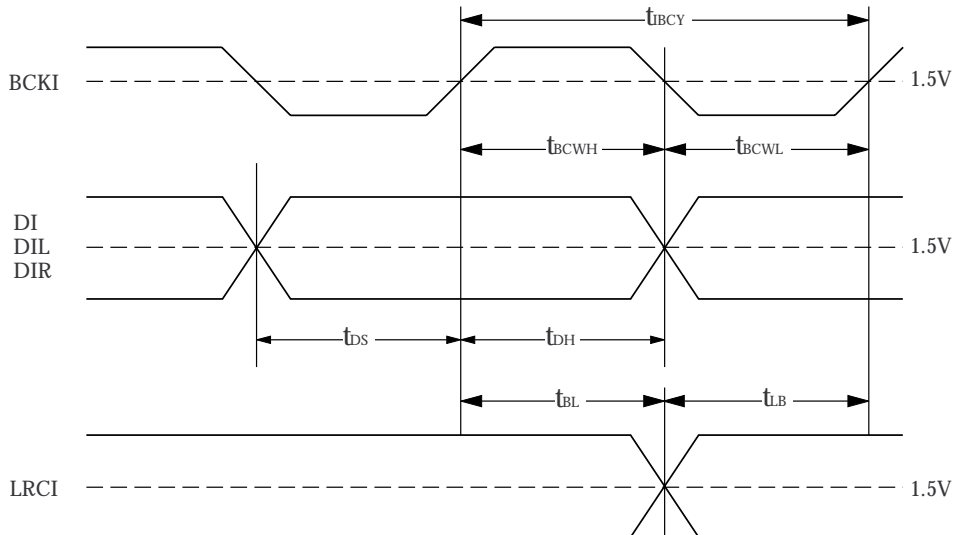

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
256fs (CKSLN = LOW, CKDV1 = LOW, CKDV2 = LOW)						
System clock frequency	$f_{SYS1}$	$V_{DD} = V_{DDAC} = 4.50$ to $5.25$ V	0.256	-	27.6	MHz
		$V_{DD} = V_{DDAC} = 3.00$ to $5.25$ V	0.256	-	25	
192fs (CKSLN = HIGH, CKDV1 = LOW, CKDV2 = LOW)						
System clock frequency	$f_{SYS2}$	$V_{DD} = V_{DDAC} = 4.75$ to $5.25$ V, $T_a = -40$ to $70$ °C	0.384	-	37	MHz
		$V_{DD} = V_{DDAC} = 3.00$ to $5.25$ V	0.384	-	20.7	

**Serial input timing (BCKI, LRCI, DI/INF2N, IW1N/DIL, IW2N/DIR)**

$V_{SS} = V_{SSAC} = 0\text{ V}$ ,  $T_a = -40\text{ to }85\text{ }^\circ\text{C}$

### Filter Characteristics

#### 8-times interpolation filter

Parameter	Rating
Passband	0 to 0.4535fs
Stopband	0.5465fs to 7.4535fs
Passband ripple	$\leq \pm 0.00002$ dB
Stopband attenuation	$\geq 117$ dB
Group delay	Constant

#### 8fs filter response with deemphasis OFF

#### 8fs filter band transition response with deemphasis OFF

#### 8fs filter passband response with deemphasis OFF

**4-times interpolation filter**

Parameter	Rating
Passband	0 to 0.4535fs
Stopband	0.5465fs to 3.4535fs
Passband ripple	$\leq \pm 0.00002$ dB
Stopband attenuation	$\geq 116$ dB
Group delay	Constant

**4fs filter response with deemphasis OFF**

**4fs filter band transition response with deemphasis OFF**

**4fs filter passband response with deemphasis OFF**

**Deemphasis filter**

Parameter		Sampling frequency (fs)		
		32 kHz	44.1 kHz	48 kHz
Passband bandwidth (kHz)		0 to 14.5	0 to 20.0	0 to 21.7
Deviation from ideal characteristic	Attenuation	≤ ±0.01 dB		
	Phase, θ	0 to 1.5°		

**Passband response with deemphasis ON**

## FUNCTIONAL DESCRIPTION

### Oversampling (Interpolation)

The interpolation arithmetic block is comprised of 3 cascaded, 2-times FIR interpolation filters, as shown in figure 1. The input signal is sampled at rate  $f_s$ , and then either 4-times or 8-times oversampling data is

output. Sampling noise in the 0.5465 $f_s$  to 3.4535 $f_s$  (4 $f_s$  output) or 0.5465 $f_s$  to 7.4535 $f_s$  (8 $f_s$  output) region is removed.

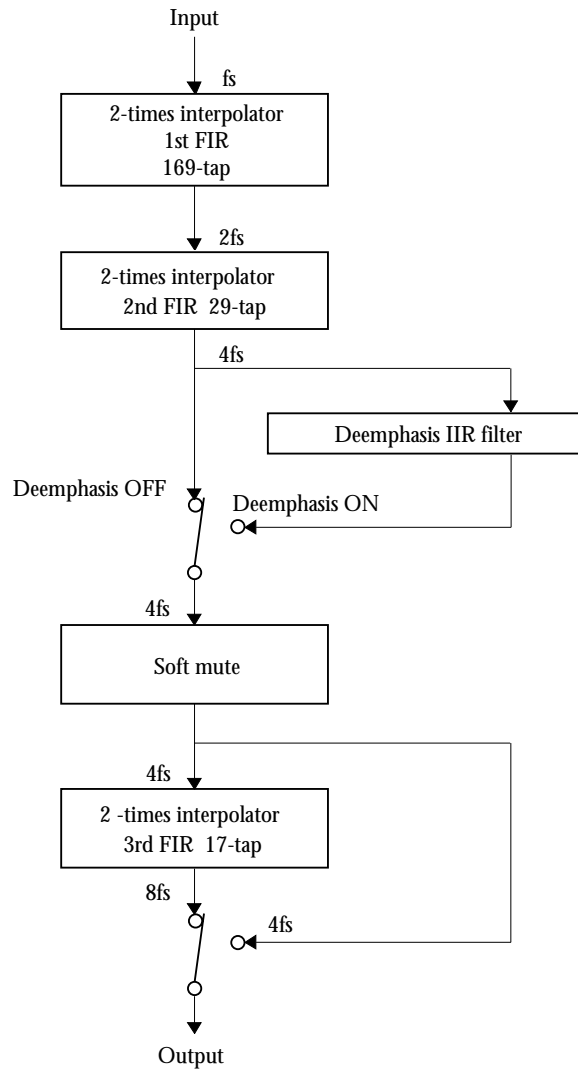

Figure 1. Arithmetic operating block

### Digital Deemphasis (DEMPL, DEMPR, FSEL1, FSEL2)

Most deemphasis filters are constructed using analog circuit techniques. Here, an IIR filter is employed to faithfully reproduce the gain and phase characteristics of standard analog deemphasis filters, corresponding to analog 50µs/15µs frequency characteristics. Three sets of filter coefficients for the three  $f_s = 32/44.1/48$  kHz sampling frequencies are supported. Deemphasis for other values of  $f_s$  are not supported.

#### Deemphasis ON/OFF (DEMPL, DEMPR)

Deemphasis for the left and right-channel can be controlled independently.

Table 1. Deemphasis control

DEMPL	DEMPR	Deemphasis
LOW	×	Left-channel OFF
HIGH	×	Left-channel ON
×	LOW	Right-channel OFF
×	HIGH	Right-channel ON

### Soft Muting (MUTEL, MUTER)

The muting function controls the muting of left and right-channel independently. Input data continues to be accepted even when mute is operating.

#### Mute ON/OFF

When MUTEL (MUTER) goes HIGH, the attenuation changes smoothly from 0 to  $-\infty$  dB. Similarly, when MUTEL (MUTER) goes LOW, muting is released and the attenuation changes smoothly from  $-\infty$  to 0 dB. This operation is termed soft muting.

Soft muting takes an interval of approximately  $512/f_s$ , or about 11.6 ms when  $f_s = 44.1$  kHz.

Table 3. Mute control

MUTEL	MUTER	Soft muting
LOW	×	Left-channel OFF
HIGH	×	Left-channel ON
×	LOW	Right-channel OFF
×	HIGH	Right-channel ON

### Filter coefficient select (FSEL1, FSEL2)

Table 2. Deemphasis filter coefficient select

FSEL1	FSEL2	Sampling frequency (fs)
LOW	LOW	44.1 kHz
LOW	HIGH	48 kHz
HIGH	LOW	Prohibited mode
HIGH	HIGH	32 kHz

### Mute operation at reset

When RSTN goes LOW, the DOL and DOR outputs are immediately muted to  $-\infty$  dB. When RSTN goes HIGH, reset is released and the outputs are immediately set to 0 dB attenuation.

Note that even when either MUTEL or MUTER or both are HIGH, the reset operation takes precedence.

### Analog Output Click Noise

Under the following conditions, a click noise may be output from the DAC (digital-to-analog converter) connected to the SM5847AF.

- When a system reset on RSTN occurs
- When the internal system clock mode, set by CKSLN, CKDV1, and CKDV2, is switched
- When the deemphasis mode, set by DEMPL, DEMPR, FSEL1, and FSEL2, is switched

- When the audio data input mode, set by INF1N, DI/INF2N, IW1N/DIL, and IW2N/DIR, is switched
- When the SYNCN jitter-free mode switch timing exceeds the internal timing delay limit

An external muting circuit connected to the analog output may be required to eliminate this noise.

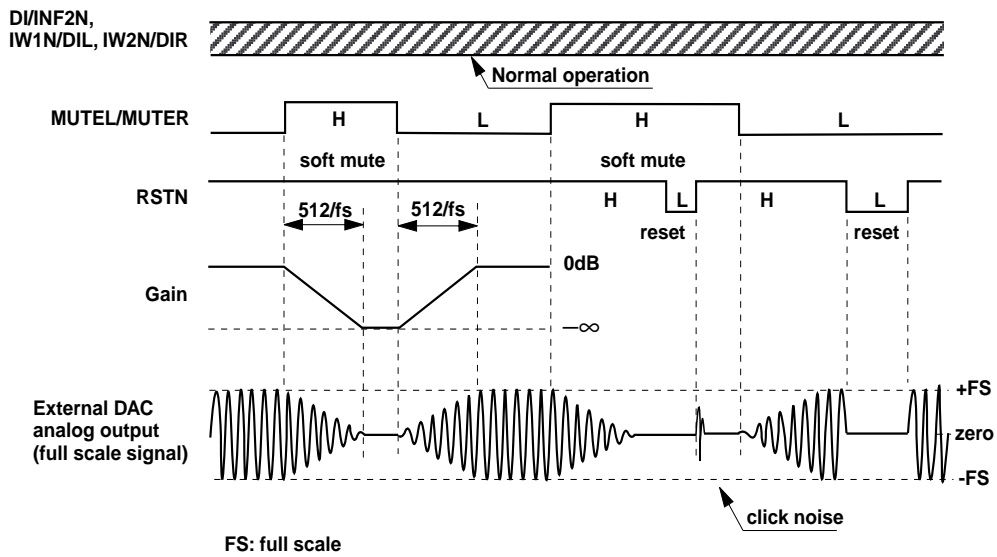

Figure 2. Soft muting/reset operation

**Internal System Clock (XTI, XTO, CKO, CKSLN, CKDV1, CKDV2)**

The SM5847AF supports two system clock frequencies selected by CKSLN, 192fs and 256fs, where fs is the sampling frequency.

The master clock can be provided either by a crystal oscillator connected between XTI and XTO, or by an external master clock input on XTI. Note that the feedback resistor required by the oscillator option is not built-in. External components should be selected to match the crystal oscillator element. Note also that XTO must be left open (floating) for the external master clock input option.

Note that even though it is necessary that the master clock and LRCI clock (sampling frequency fs) be in sync, it is not necessary that they be exactly in-phase (see jitter-free mode description).

The SM5847AF features independent divide-by 1, 2, or 4 counter, selected by CKDV1 and CKDV2. This provides the 192fs or 256fs system clock with the necessary divider ratios to support master clocks with frequencies of 768fs, 384fs, 192fs, 1024fs, 512fs or 256fs.

Normal sampling frequencies 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, 176.4 kHz and 192 kHz are supported. However, some combinations of sampling frequency and master clock frequency are not supported, as follows.

- 768fs and 1024fs at 88.2 and 96 kHz
- 768fs, 384fs, 1024fs, 512fs, and 256fs at 176.4 kHz
- 768fs, 384fs, 1024fs, 512fs and 256fs at 192 kHz

Note also that the internal crystal oscillator circuit cannot operate at frequencies  $\geq 50$  MHz. The master clock input on XTI is output on CKO.

**Master clock stop operation**

The master clock is input after power is applied.

But if, after the XTI and LRCI clocks are input and power-ON reset occurs with all-zero input audio data, the master clock input on XTI is held either HIGH or LOW level, operation effectively stops. Note also that a reset signal is not accepted when the master clock and LRCI clock stop.

Table 4. Internal system clock select

CKSLN	System clock
LOW	256fs
HIGH	192fs

Table 5. System clock frequency divider ratio select

CKDV1	CKDV2	Divider ratio	Master clock
LOW	LOW	1	192fs, 256fs
LOW	HIGH	-	Prohibited mode
HIGH	LOW	4	768fs, 1024fs
HIGH	HIGH	2	384fs, 512fs

1. Refer to the AC characteristics system clock ratings.

### System Reset (RSTN)

During normal device operation, reset signals are not required. However, the SM5847AF must be reset under the following conditions.

- At power-ON
- When the LRCI clock and internal operation timing need to be resynchronized in jitter-free mode.
- After the LRCI or XTI clocks, or both, stop and are subsequently started.

The system is reset by applying a LOW-level pulse on RSTN.

When RSTN is LOW, the DOL and DOR outputs are tied LOW, muting the output signal to an attenuation level of  $-\infty$ .

After system reset, when RSTN goes HIGH, the arithmetic and output timing counters are reset on the first LRCI start edge, assuming that the XTI and LRCI input clocks have already stabilized. The LRCI start edge is determined by the state of INF1N and INF2N. When INF1N is LOW or when both INF1N and INF2N are HIGH, the start edge is the rising edge. When INF1N is HIGH and INF2N is LOW, the start edge is the falling edge.

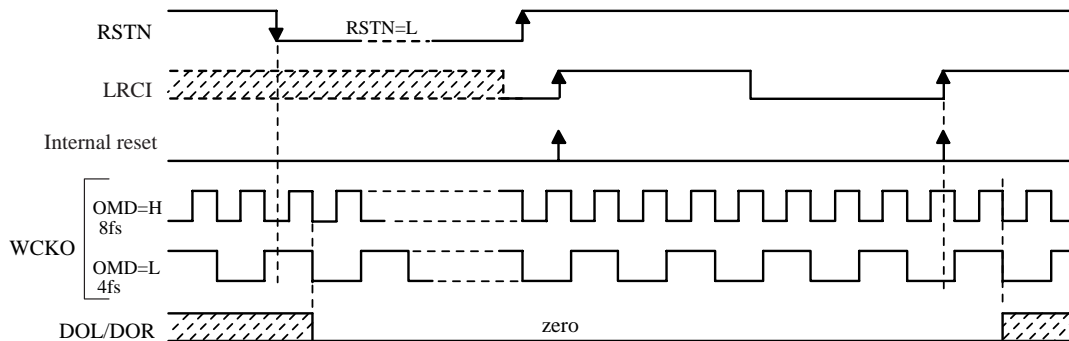

Figure 5. System reset timing and output muting (INF1N = LOW or INF1N = INF2N = HIGH)

### Audio Data Input (INF1N, DI/INF2N, IW1N/DIL, IW2N/DIR, BCKI, LRCI)

The input data format and input pin functions are selected by the state of INF1N and INF2N. When INF1N is LOW, the inputs are left and right-channel

data inputs, and when INF1N is HIGH, the DI/INF2N input is an input format select pin, and DIL and DIR are the audio data inputs.

#### Input data format select

Table 7. Input settings and functions

INF1N	DI/INF2N	Input format	Pin function selection		
			DI/INF2N	IW1N/DIL	IW2N/DIR
LOW	–	LR alternating <sup>1</sup> , right-justified data	DI	IW1N	IW2N
LOW	–				
HIGH	LOW	LR alternating, left-justified data	INF2N	DIL	DIR
HIGH	HIGH	LR simultaneous <sup>2</sup> , left-justified data			

1. Alternating left-channel and right-channel data input on a single input DI.

2. Simultaneous left-channel and right-channel data input on two inputs, DIL and DIR, respectively.

#### Input data word length

The input data word length is selected by the state of IW1N and IW2N when INF1N is LOW. 20-bit is selected when INF1N is HIGH.

Table 8. Input data word length select

INF1N	IW1N/DIL	IW2N/DIR	Input word length
LOW	LOW	LOW	24 bits
	HIGH	LOW	20 bits
	LOW	HIGH	18 bits
	HIGH	HIGH	16 bits
HIGH	–	–	24 bits

### Jitter-free Function (SYNCN)

The arithmetic circuit and output control timing is derived from the system clock, and is therefore independent of the input LRCI and BCKI clocks. Accordingly, any jitter in the data input clock (LRCI and BCKI) does not cause jitter in the output.

Generally, the internal timing is synchronized to the LRCI input timing after a system reset release, when RSTN goes from LOW to HIGH, on the first LRCI clock start edge. If the input timing and LRCI start edge timing subsequently drift, the input timing is automatically resynchronized when the timing error exceeds a certain value. There are 2 timing error values at which resynchronization occurs, selected by the state of SYNCN.

#### Jitter-free mode (SYNCN = HIGH)

When SYNCN is HIGH, the timing error value is  $\pm 3/8 \times$  (LRCI clock period). When the difference between the input timing and LRCI start edge position do not exceed this value, internal timing is not

resynchronized and all functions continue to operate normally.

#### Sync mode (SYNCN = LOW)

When SYNCN is LOW, the timing error value is  $\pm 1 \times$  (XTI master clock period), which is a much smaller timing error tolerance than in jitter-free mode. In this mode, the internal timing is guaranteed to follow the LRCI clock timing within this tolerance, making this mode useful for systems constructed from a multiple number of SM5847AF devices.

**Audio Data Output (DOL, DOR, BCKO, WCKO, DG, OW1N, OW2N, OMD, DITHN)**

**Output data format**

The output data is in serial, simultaneous left and right-channel, 2s complement, MSB first, BCKO burst (NPC format) format. Left-channel data is output on DOL, and right-channel data is output on DOR.

**Output data word length**

The output data word length is selected by the state of OW1N and OW2N.

**Output timing**

The output timing is dependent on the CKSLN level and output data word length.

When CKSLN is LOW, the output timing does not change with the output data word length. However, when CKSLN is HIGH, the DOL and DOR output timing for 24-bit output data length (OW1N = OW2N = LOW) start 1 clock cycle earlier than for 18, 20, or 22-bit output data length.

Table 9. Output data word length select

OW1N	OW2N	Output word length
LOW	LOW	24 bits
HIGH	LOW	22 bits
LOW	HIGH	20 bits
HIGH	HIGH	18 bits

Table 10. Output timing

Parameter	Symbol	CKSLN	OMD = HIGH	OMD = LOW
Bit clock rate	T <sub>B</sub>	HIGH	1/192fs	1/96fs
		LOW	1/256fs	1/128fs
Data word length	T <sub>DW</sub>	HIGH	24t <sub>SYS</sub>	48t <sub>SYS</sub>
		LOW	32t <sub>SYS</sub>	64t <sub>SYS</sub>

**Output mode**

The output mode, either 4fs oversampling or 8fs oversampling, is selected by the level on OMD, where fs is the input sampling rate.

Table 11. Output mode select

OMD	Output mode
LOW	4fs
HIGH	8fs

**Output dither processing**

The output data word length is set by OW1N and OW2N, whereas the SM5847AF performs all internal calculations in 25-bit words. As a consequence, dither processing is provided to round-off errors. The SM5847AF uses triangular dither processing (triangular probability density function or TPDF) and can be turned ON or OFF. Simple round-off processing occurs when dither is OFF (DITHN = HIGH).

Table 12. Dither select

DITHN	Dither
LOW	ON
HIGH	OFF

### Group Delay

The data input to data output group delay is the delay which occurs due to the digital filter calculations. It is the time between the serial input data is completely read in (at rate  $f_s$ ) until the serial data is output (at rate  $8f_s$  or  $4f_s$ , depending on the mode selected).

$t_{INPUT}$  represents the LRCI clock rising edge after the serial input data has been read in at rate  $f_s$ .

$t_{OUTPUT}$  represents the WCKO clock falling edge at the start of serial data output at rate  $8f_s$  or  $4f_s$ .

Table 13. Group delay

Mode			Group delay	Unit
CKSLN	SYN CN		$t_{OUTPUT} - t_{INPUT}$	
LOW (256fs)	LOW	After reset, or sync mode	48.625/fs	sec
	HIGH	Jitter-free mode	48.25/fs – 49.0/fs	
HIGH (192fs)	LOW	After reset, or sync mode	48.75/fs	
	HIGH	Jitter-free mode	48.375/fs – 49.125/fs	

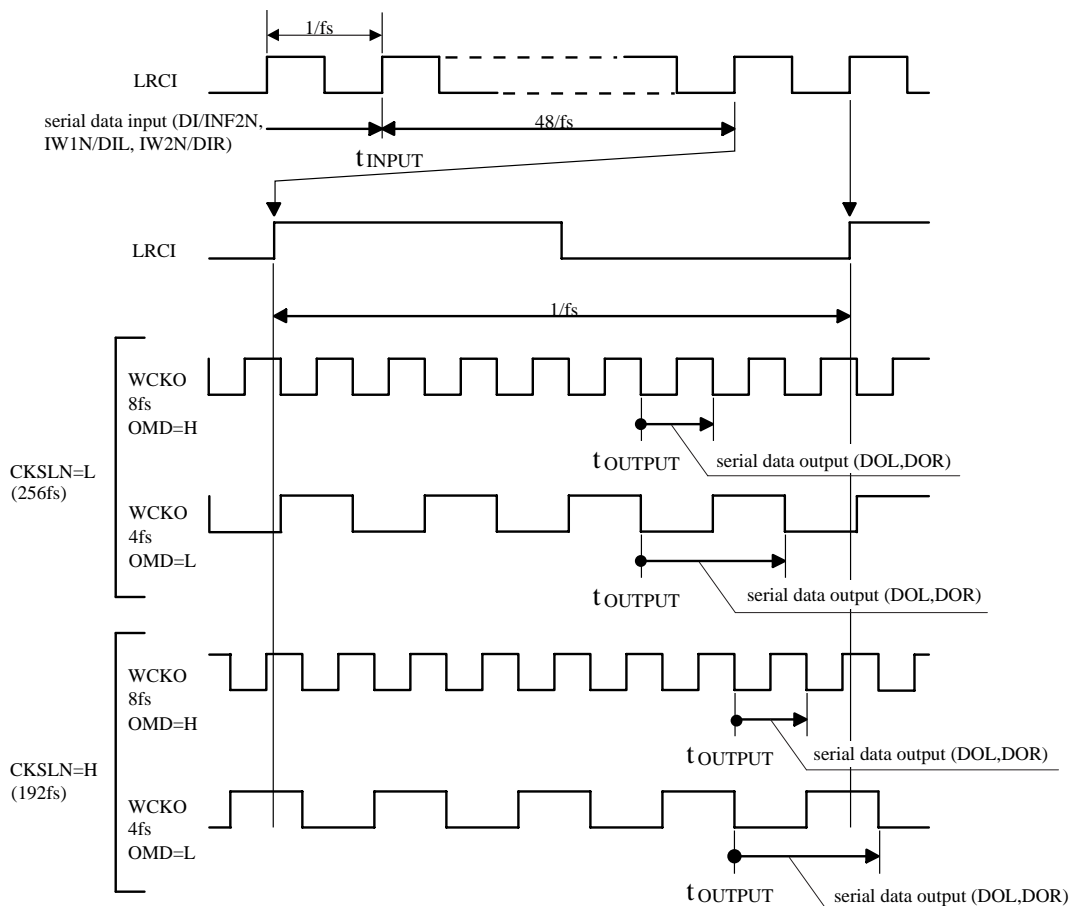

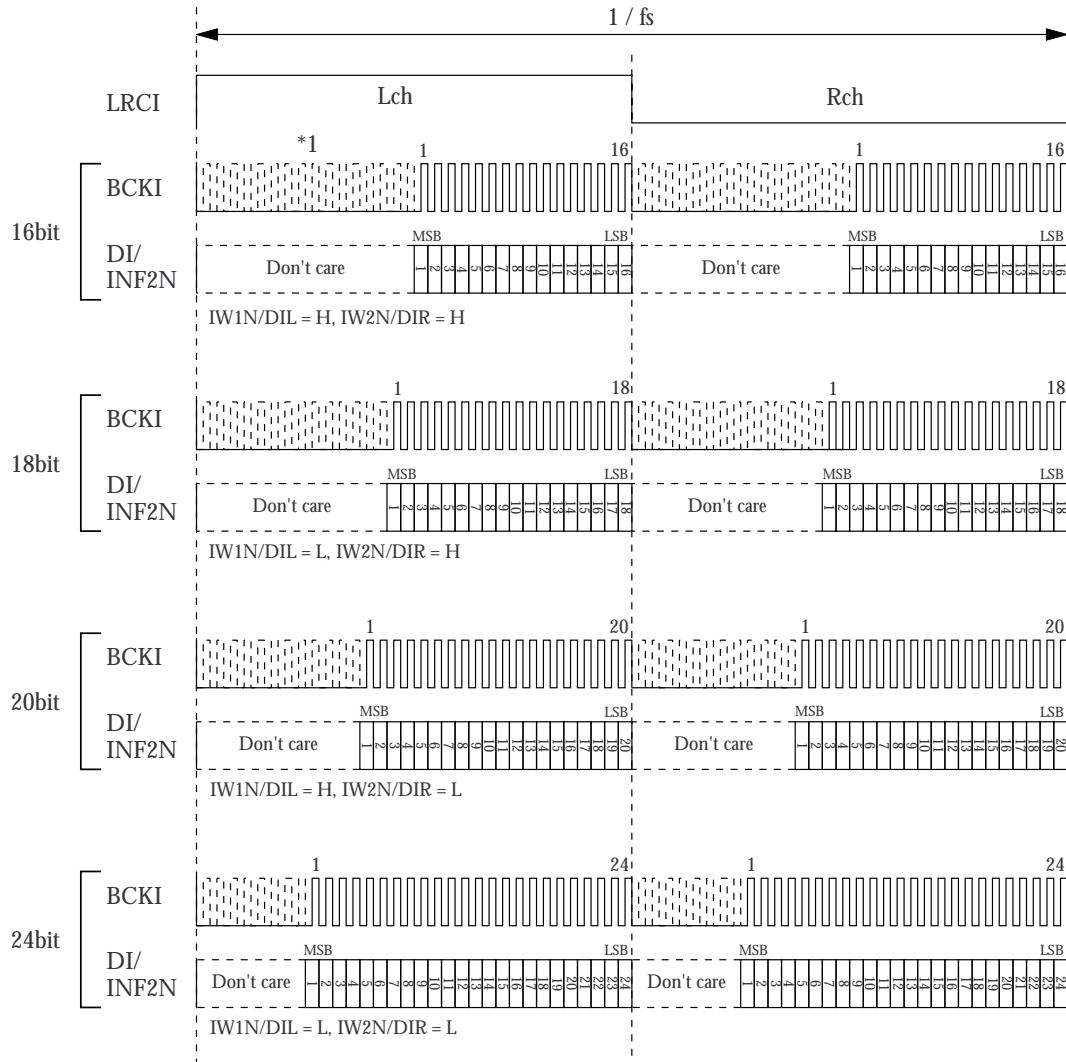

Figure 6. Group delay timing (SYN CN = LOW)
