

## High-Z, Programmable Gain, Differential Amplifier

### Features

- Signal Bandwidth: DC to 2 kHz
- Selectable Gain: x1, x2, x4, x8, x16, x32, x64
- Differential Inputs, Differential Outputs
  - Multiplexed inputs: INA, INB, 800Ω termination
  - Rough / fine charge outputs for CS5371/72
  - Max signal amplitude: 5 V<sub>pp</sub> differential
  - Ultra-low input bias: < 1 pA
- Excellent Noise Performance
  - 1 μV<sub>p-p</sub> between 0.1 Hz and 10 Hz
  - 8.5 nV/√Hz from 200 Hz to 2 kHz
- Low Total Harmonic Distortion
  - -118 dB THD typical (0.000126%)
  - -112 dB THD maximum (0.000251%)
- Low Power Consumption
  - Normal / LPWR / PWDN: 5 mA, 3.3 mA, 10 μA
- Single or Dual Power Supply Configurations
  - VA+ = +5 V; VA- = 0 V; VD = +3.3 V to +5 V
  - VA+ = +2.5 V; VA- = -2.5 V; VD = +3.3 V

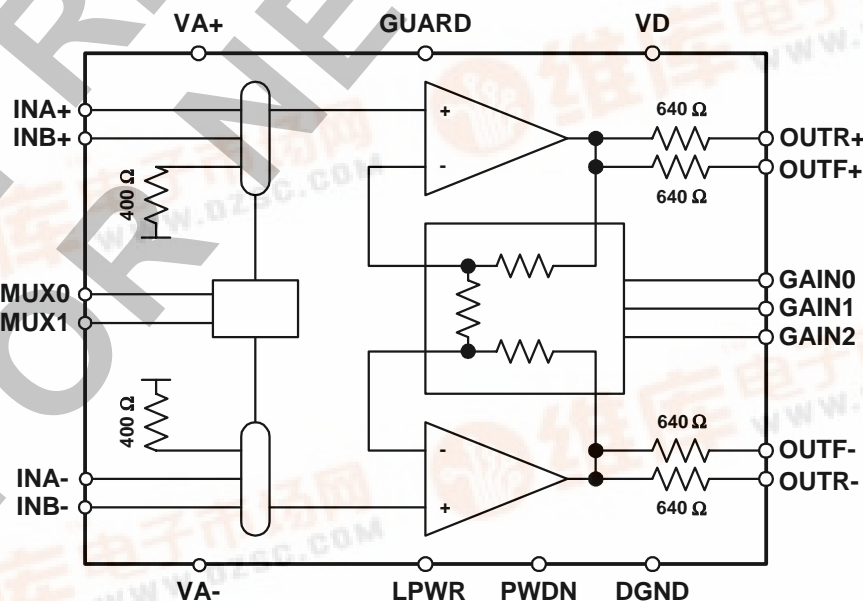

### Description

The CS3302 is a high-input-impedance, differential input, differential output amplifier with programmable gain, optimized for amplifying signals from high-impedance sensors such as hydrophones. The gain settings are binary weighted (x1, x2, x4, x8, x16, x32, x64) and are selected using simple pin settings. Two sets of external inputs, INA and INB, simplify system design as inputs from a sensor and test DAC. An internal 800Ω termination can also be selected for noise tests.

Amplifier input impedance is very high, requiring less than 1 pA of input current. Noise performance is very good at 1 μV<sub>p-p</sub> between 0.1 Hz and 10 Hz, and a noise density of 8.5 nV/√Hz over the 200 Hz to 2 kHz bandwidth. Distortion performance is also extremely good, typically -118 dB THD. Low input current, low noise, and low total harmonic distortion make this amplifier ideal for high-impedance differential sensors requiring maximum dynamic range.

## REVISION HISTORY

Revision	Date	Changes
PP2	JUL 2003	Final preliminary release.
F1	AUG 2005	Updated legal notice. Added MSL data.
F2	SEP 2005	Updated anti-alias resistor values, relative gain accuracy, input voltage noise, and CS4373A part number.
F3	DEC 2007	Added watermark to indicate device is not recommended for new designs.

## 1. CHARACTERISTICS AND SPECIFICATIONS

- Min/Max characteristics and specifications are guaranteed over the Specified Operating Conditions.
- Typical performance characteristics and specifications are derived from measurements taken at nominal supply voltages and  $T_A = 25^\circ\text{C}$ .
- DGND = 0 V, all voltages with respect to 0 V.

### SPECIFIED OPERATING CONDITIONS

Parameter	Symbol	Min	Nom	Max	Unit	
<b>Unipolar Power Supplies</b>						
Positive Analog	VA+	4.75	5.0	5.25	V	
Negative Analog (Note 1)	VA-	-0.25	0	0.25	V	
Positive Digital (Note 2)	VD	3.135	3.3	5.25	V	
<b>Bipolar Power Supplies</b>						
Positive Analog	VA+	2.375	2.5	2.625	V	
Negative Analog (Note 1)	VA-	-2.625	-2.5	-2.375	V	
Positive Digital (Note 2)	VD	3.135	3.3	3.465	V	
<b>Thermal</b>						
Ambient Operating Temperature	Industrial (-IS, -ISZ)	$T_A$	-40	-	85	$^\circ\text{C}$

- Notes: 1. VA- must be the most negative voltage to avoid potential SCR latch-up conditions.  
 2. VD must conform to Digital Supply Differential under Absolute Maximum Ratings.

### ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	CS3302		Unit	
		Min	Max		
DC Power Supplies	Positive Analog	VA+	-0.3	6.8	V
	Negative Analog	VA-	-6.8	0.3	V
	Digital	VD	-0.3	6.8	V
Analog Supply Differential	$[(VA+) - (VA-)]$	$VA_{DIFF}$	-	6.8	V
Digital Supply Differential	$[(VD) - (VA-)]$	$VD_{DIFF}$	-	6.8	V
Input Current, Any Pin Except Supplies (Note 3)	$I_{IN}$	-	$\pm 10$	mA	
Input Current, Power Supplies (Note 3)	$I_{IN}$	-	$\pm 50$	mA	
Output Current (Note 3)	$I_{OUT}$	-	$\pm 25$	mA	
Power Dissipation	PDN	-	500	mW	
Analog Input Voltages	$V_{INA}$	$(VA-) - 0.5$	$(VA+) + 0.5$	V	
Digital Input Voltages	$V_{IND}$	-0.5	$(VD) + 0.5$	V	
Ambient Operating Temperature (Power Applied)	$T_A$	-40	85	$^\circ\text{C}$	
Storage Temperature Range	$T_{STG}$	-65	150	$^\circ\text{C}$	

WARNING: Operation at or beyond these limits may result in permanent damage to the device.  
 Normal operation is not guaranteed at these extremes.

- Notes: 3. Transient currents up to 100mA will not cause SCR latch-up.

## THERMAL CHARACTERISTICS

Parameter	Symbol	CS3302			Unit
		Min	Typ	Max

Input Voltage Noise Density $f_0 = 200 \text{ Hz to } 2 \text{ kHz}$	$V_{ND}$	-	8.5	12	$nV/\sqrt{Hz}$
Input Current Noise Density (Note 4)	$I_{ND}$	-	20	-	$fA/\sqrt{Hz}$
<b>Noise Performance, Low Power (LPWR=1)</b>					
Input Voltage Noise $f_0 = 0.1 \text{ Hz to } 10 \text{ Hz}$	$V_{NPP}$	-	1	3	$\mu V_{pp}$
Input Voltage Noise Density $f_0 = 200 \text{ Hz to } 2 \text{ kHz}$	$V_{ND}$	-	10	15	$nV/\sqrt{Hz}$
Input Current Noise Density (Note 4)	$I_{ND}$	-	1	-	$fA/\sqrt{Hz}$
<b>Distortion Performance, Normal Power</b>					
Total Harmonic Distortion (Note 5, 6)	THD	-	-118	-112	dB
Linearity (Note 5, 6)	LIN	-	0.000126	0.000251	%
<b>Distortion Performance, Low Power (LPWR=1)</b>					
Total Harmonic Distortion (Note 5, 6)	THD	-	-118	-110	dB
Linearity (Note 5, 6)	LIN	-	0.000126	0.000316	%

- Notes: 4. Guaranteed by design and/or characterization.  
 5. Tested with a full scale input signal of 31.25 Hz.  
 6. Noise in the harmonic bins dominates THD and linearity measurements for x16, x32, and x64 gains.

Figure 1. CS3302 Noise Performance

## ANALOG CHARACTERISTICS (CONT.)

Parameter	Symbol	CS3302			Unit
		Min	Typ	Max	
<b>Gain</b>					
Gain, Differential	GAIN	x1	-	x64	
Gain, Common Mode (Note 7)	GAIN <sub>CM</sub>	-	x1	-	
Gain Accuracy, Absolute (Note 8)	GAIN <sub>ABS</sub>	-	±1	±2	%
Gain Accuracy, Relative (Note 9)	GAIN <sub>REL</sub>	-	±0.2	±0.5	%
Gain Drift (Note 4, 10)	GAIN <sub>TC</sub>	-	5	-	ppm / °C
<b>Offset</b>					
Offset Voltage, Input Referred (Note 11)	OFST	-	±250	±750	μV
Offset After Calibration, Absolute (Note 12)	OFST <sub>CAL</sub>	-	±1	-	μV
Offset Calibration Range (Note 13)	OFST <sub>RNG</sub>	-	100	-	% F.S.
Offset Voltage Drift (Note 4, 10)	OFST <sub>TC</sub>	-	1	-	μV / °C

- Notes:
7. Common mode signals pass through the differential amplifier architecture.
  8. Absolute gain accuracy tests the matching of x1 gain across multiple CS3302 devices.
  9. Relative gain accuracy tests the tracking of x1,x2, x4,x16,x32,x64 gain relative to x8 gain on a single CS3302 device.
  10. Specification is for the parameter over the specified temperature range and is for the CS3302 device only. It does not include the effects of external components.
  11. Offset voltage is tested with the amplifier inputs connected to the internal 800Ω termination.
  12. The absolute offset after calibration specification applies to the effective offset voltage of the CS3302 output when used with the CS5371/72 modulator and CS5376A digital filter, and is measured from the digitally calibrated output codes of the CS5376A.
  13. The CS3302 offset calibration is performed digitally with the CS5371/72 modulator and CS5376A digital filter and includes the full scale signal range. Calibration offsets of greater than ± 5% of full scale will begin to subtract from system dynamic range.

## ANALOG CHARACTERISTIC (Cont.)

Parameter	Symbol	CS3302			Unit
		Min	Typ	Max	
<b>Analog Input Characteristics</b>					
Input Signal Frequencies	BW	DC	-	2000	Hz
Input Voltage Range (Signal + Vcm) (Note 14)	x1 x2 - x64 $V_{IN}$	(VA-)+0.7 (VA-)+0.7	- -	(VA+)-1.25 (VA+)-1.75	V

## POWER SUPPLY CHARACTERISTICS

Parameter	Symbol	CS3302			Unit
		Min	Typ	Max	
<b>Power Supply Current, Normal Mode</b>					
Analog Power Supply Current (Note 18)	$I_A$	-	5.0	5.75	mA
Digital Power Supply Current (Note 18)	$I_D$	-	0.1	0.2	mA
<b>Power Supply Current, Low Power Mode</b>					
Analog Power Supply Current, LPWR = 1 (Note 18)	$I_A$	-	3.4	4.0	mA
Digital Power Supply Current, LPWR = 1 (Note 18)	$I_D$	-	0.1	0.2	mA
<b>Power Supply Current, Power Down Mode</b>					
Analog Power Supply Current, PWDN = 1 (Note 18)	$I_A$	-	9	11	$\mu$ A
Digital Power Supply Current, PWDN = 1 (Note 18)	$I_D$	-	2	8	$\mu$ A
<b>Power Supply Rejection</b>					
Power Supply Rejection Ratio (Note 4, 19)	PSRR	95	120	-	dB

- Notes: 18. All outputs unloaded. Analog inputs connected to the internal 800  $\Omega$  termination. Digital inputs forced to VD or DGND respectively.
19. Power supply rejection characterized with a 50 Hz, 400 mV<sub>pp</sub> sine wave applied separately to each supply.

## 2. GENERAL DESCRIPTION

The CS3302 is a high-impedance, low-noise CMOS differential input, differential output amplifier for precision analog signals between DC and 2 kHz. It has multiplexed inputs, rough/fine charge outputs, and programmable gains of x1, x2, x4, x8, x16, x32, and x64.

The amplifier's performance makes it ideal for low-frequency, high-dynamic-range applications requiring low distortion and minimal power consumption. It's optimized for use in acquisition systems designed around the CS5371/72 single/dual  $\Delta\Sigma$  modulators and the CS5376A quad digital filter. **Figure 3** shows the system-level architecture of a 4-channel acquisition system using four CS3302, two CS5372, one CS4373A, and one CS5376A.

### 2.1 Analog Signals

#### 2.1.1 Analog Inputs

The amplifier analog inputs are designed for high-impedance differential sensors. Input multiplexing simplifies system connections by providing separate inputs for a sensor and test DAC (INA, INB) as well as an internal termination for noise tests. The MUX0, MUX1 digital pins determine which multiplexed input is connected to the amplifier.

#### 2.1.2 Analog Outputs

The amplifier analog outputs are separated into rough charge / fine charge signals to easily connect to the CS5371/72 inputs. Each output also includes a series resistor, requiring only two differential capacitors to create the CS5371/72 input anti-alias filter.

Figure 3. System Architecture

### 2.1.3 Differential Signals

Analog signals into and out of the CS3302 are differential, consisting of two halves with equal but opposite magnitude varying about a common mode voltage.

A full scale  $5 V_{pp}$  differential signal centered on a  $-0.15 V$  common mode can have:

$$SIG+ = -0.15 V + 1.25 V = 1.1 V$$

$$SIG- = -0.15 V - 1.25 V = -1.4 V$$

SIG+ is  $+2.5 V$  relative to SIG-

For the reverse case:

$$SIG+ = -0.15 V - 1.25 V = -1.4 V$$

$$SIG- = -0.15 V + 1.25 V = 1.1 V$$

SIG+ is  $-2.5 V$  relative to SIG-

The total swing for SIG+ relative to SIG- is  $(+2.5 V) - (-2.5 V) = 5 V_{pp}$ . A similar calculation can be done for SIG- relative to SIG+. Note that a  $5 V_{pp}$  differential signal centered on a  $-0.15 V$  common mode voltage never exceeds  $1.1 V$  and never drops below  $-1.4 V$  on either half of the signal.

By definition, differential voltages are to be measured with respect to the opposite half, not relative to ground. A multimeter differentially measuring between SIG+ and SIG- in the above example would properly read  $1.767 V_{rms}$ , or  $5 V_{pp}$ .

### 2.1.4 Guard Output

The GUARD pin outputs the common mode voltage of the currently selected analog signal input. It can be used to drive the cable shield between a high-impedance sensor and the amplifier inputs. Driving the cable shield with the analog signal common mode voltage minimizes leakage and improves signal integrity from high-impedance sensors.

The GUARD output is defined as the midpoint voltage between the + and - halves of the currently selected differential input signal, and will vary as

the signal common mode varies. The GUARD output will not drive a significant load, it only provides a shielding voltage.

## 2.2 Digital Signals

### 2.2.1 Gain Selection

The CS3302 supports gain ranges of x1, x2, x4, x8, x16, x32, and x64. They are selected using the GAIN0, GAIN1, and GAIN2 pins as shown in [Table 1 on page 8](#).

### 2.2.2 Mux Selection

The analog inputs to the amplifier are multiplexed, with external signals applied to the INA+, INA- or INB+, INB- pins. An internal termination is also available for noise tests. Input mux selection is made using the MUX0 and MUX1 pins as shown in [Table 1 on page 8](#).

Although a mux selection is provided to enable the INA and INB switches simultaneously, significant current should not be driven through them in this mode. The CS3302 mux switches will maintain good linearity only with minimal signal current.

### 2.2.3 Low Power Selection

For applications where power is critical, a low-power mode can be selected. This mode reduces amplifier power consumption at the expense of slightly degraded performance. Low power mode is selected using the LPWR pin, which is active high.

### 2.2.4 Power Down Selection

A power-down mode is available to shut down the amplifier when not in use. When enabled, all internal circuitry is disabled, the analog inputs and outputs go high-impedance, and the device enters a micro-power state. Power down mode is selected using the PWDN pin, which is active high.

## 2.3 Power Supplies

### 2.3.1 Analog Power Supplies

The analog power pins of the CS3302 are to be supplied with a total of  $5 V$  between VA+ and VA-

This voltage is typically from a bipolar  $\pm 2.5$  V supply. When using bipolar supplies the analog signal common mode voltage should be biased to 0 V. The analog power supplies are recommended to be bypassed to system ground using 0.1  $\mu$ F X7R type capacitors.

The VA- supply is connected to the CMOS substrate and as such must remain the most negative applied voltage to prevent potential latch-up conditions. Care should be taken to ensure analog input voltages do not drop more than -0.3 V below the VA- supply. Care should also be taken to establish

the VA- supply before analog signals are applied to the device. It is recommended to clamp the VA- supply to system ground using a reverse biased Schottky diode to prevent possible latch-up conditions related to mismatched supply rail initialization.

### 2.3.2 Digital Power Supplies

The digital power supply across the VD and DGND pins is flexible and can be set to interface with 3.3 V or 5 V logic. The digital power supply should be bypassed to system ground using a 0.01  $\mu$ F X7R type capacitor.

NOT RECOMMENDED FOR NEW DESIGNS

## 2.4 Connection Diagram

Figure 4 shows a connection diagram for the CS3302 amplifier when used with the CS5372 dual  $\Delta\Sigma$  modulator, the CS4373A test DAC and the CS5376A digital filter. The diagram shows differ-

ential sensors, a test DAC, and analog outputs with anti-alias capacitors; power supply connections including recommended bypassing; and digital control connections back to the CS5376A GPIO pins.

## 6. PACKAGE DIMENSIONS

### 24 PIN SSOP PACKAGE DRAWING

DIM	INCHES		MILLIMETERS		NOTE
	MIN	MAX	MIN	MAX	
A	--	0.084	--	2.13	
A1	0.002	0.010	0.05	0.25	
A2	0.064	0.074	1.62	1.88	
b	0.009	0.015	0.22	0.38	2,3
D	0.311	0.335	7.90	8.50	1
E	0.291	0.323	7.40	8.20	
E1	0.197	0.220	5.00	5.60	1
e	0.024	0.027	0.61	0.69	
L	0.025	0.040	0.63	1.03	
$\infty$	0°	8°	0°	8°	

- Notes:
1. "D" and "E1" are reference datums and do not include mold flash or protrusions, but do include mold mismatch and are measured at the parting line, mold flash or protrusions shall not exceed 0.20 mm per side.
  2. Dimension "b" does not include dambar protrusion/intrusion. Allowable dambar protrusion shall be 0.13 mm total in excess of "b" dimension at maximum material condition. Dambar intrusion shall not reduce dimension "b" by more than 0.07 mm at least material condition.
  3. These dimensions apply to the flat section of the lead between 0.10 and 0.25 mm from lead tips.
