National Semiconductor
Application Note 1931
Ajay Hari
December 8, 2008

Introduction

The LM25088 evaluation board is designed to provide the design engineer with a fully functional power converter based on Emulated Current Mode Control to evaluate the LM25088 controller IC. The LM25088 evaluation board is available in two versions (like the LM25088 controller): the LM25088-1

evaluation board provides $\pm 5\%$ oscillator frequency dithering to reduce EMI and the LM25088-2 evaluation board provides hiccup mode restart to reduce over load stress. Both the evaluation boards share the same layout except for silkscreen. The printed circuit board consists of 2 layers, 2 ounce of copper top and bottom and the board size is 2.55x1.5x0.5 inches.

Specification	LM25088-1	LM25088-2
Input Voltage Range	5.5V to 36V	5.5V to 36V
Output Voltage	5.0V	5.0V
Max. Average Load Current	7A	7A
Load Regulation	2%	2%
Current Limit Type	Cycle-by-cycle current limit	Hiccup Mode Restart
Frequency	250 kHz ($\pm 5\%$ Oscillator Dithering)	250 kHz

Powering and Loading Considerations

Read this entire page prior to attempting to power the evaluation board.

QUICK SETUP PROCEDURE

Step 1: Set the power supply current limit to 10A. Turn off the power supply. Connect the power supply to the VIN terminals.

Step 2: Connect the load, with a 7A capability, to the VOUT terminals.

Step 3: Slowly increase the load while monitoring the output, VOUT should be in regulation with a nominal 5V output.

Step 4: Slowly sweep the input voltage from 5.5V to 36V, VOUT should remain in regulation with a nominal 5V output.

Step 5: Temporarily short the EN pin to check the shutdown function. Also, EN pin can be set between 0.4V and 1.2V, for example, by shorting EN pin to ground with a diode, to check the standby function.

Step 6: Increase the load beyond the rated current to check the current limiting. The output current should limit at approximately 10A. The LM25088-1 board will enter cycle-by-cycle current limiting, while LM25088-2 is configured for a hiccup mode restart. Cooling is critical in this step.

AIR FLOW

Prolonged operation with high input voltage (>24V) at full load will cause the LM25088 and MOSFETs to overheat and could potentially result in thermal shutdown. A fan with a minimum of 100LFM should always be used to cool the LM25088 evaluation board.

POWERING UP

It is suggested that the load be kept low during the first power up. Set the current limit of the source supply to provide about

1.5 times the anticipated wattage of the load. A quick efficiency check is the best way to confirm that everything is operating properly. If something is amiss one can be reasonably sure that it will affect the efficiency adversely. Few parameters can be correct in a switching power supply without creating losses and potentially damaging heat.

OVER CURRENT PROTECTION

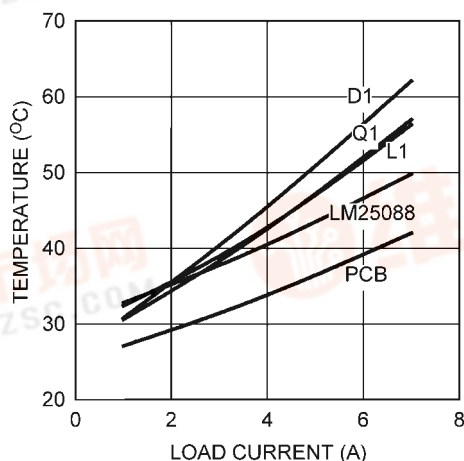

The LM25088-1 and LM25088-2 evaluation boards are both configured with over-current protection schemes. The LM25088-1 employs a cycle-by-cycle current limiting, while the LM25088-2 is configured for a hiccup mode restart. Please refer the LM25088 datasheet for more information on RES pin.

SYNCHRONIZATION

A Sync pin has been provided on the evaluation board. This pin can be used to synchronize the LM25088 to an external clock. It is recommended not to exceed 500 kHz while synchronizing. Refer the LM25088 datasheet for complete information.

ACTIVE LOADS

When using electronic load, it is strongly recommended to power up the evaluation board at light load and then slowly increase the load. This is necessary as most of the electronic loads do not draw any current till the output reaches an internally set point; this can result in soft-start function to not work as desired and can trip the current sense comparator. Electronic loads, in general, are best suited for monitoring steady state waveforms. If it is desired to power up the evaluation board at maximum load, resistor banks can be used. This will ensure a soft-start and evaluation board will perform as desired. Ensure that there is sufficient cooling for both the resistor banks and the LM25088 evaluation board, while running at full load.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
