National Semiconductor
Application Note 1621
Sheldon Mah
May 2007

General Description

The LP3972 Flex PMU is a complete power management IC designed for advanced processors. It contains 5 low noise low dropout regulators, 3 DC/DC buck converters, a backup battery charger, real time clock supply regulator [RTC], 2 GPO's and high speed I²C serial interface to program individual regulator output voltages as well as offer on/off control. This USB evaluation board features independent USB powering, virtual voltmeter bank all in a compact demonstration platform.

Key Features

- 2.7V to 5.5V input voltage range
- Programmable V_{OUT} 0.8–3.3 volts
- Up to 95% efficiency
- ±3% output voltage accuracy
- 1.5A output current [bucks]

Applications

- Personal Media Players
- Smart Phones
- PDA Phones
- Digital Cameras

Evaluation Board/Kit Overview

The LP3972 Evaluation Board supports complete functional evaluation of the power management IC. The functions of the chip are controlled by the I²C interface. The I²C interface on the rev B and later USB boards are driven via a COP8 microprocessor which supports a connection via the USB port and offers chip powering and virtual software voltage measurement of all regulators. In addition, the LP3972 can be powered directly through the USB port for full function. If high current Buck testing is desired, an external LI ION cell or PS capable of supplying 2 amps or more will need to be connected to the appropriate connector.

The evaluation board/kit consists of:

- LP3972 Flex_PMU device soldered down in LQA-40 pin 5X5 LD package
- Full USB interface
- LED LDO monitoring with current limit resistors [selectable]
- External power LDO, Buck output and main battery/supply connectors offered in heavy duty turret pins and solder pads
- Socket for back-up battery
- Users guide
- Codeloader Software version .202 or greater [may be sent via email]

Operating Instructions

The following instructions give general instructions for use of LP3972 with the evaluation board. Practice standard ESD protection (ground cable) to prevent any unwanted damaging ESD events.

1. Check that the jumpers are in default settings (jumpers are introduced later in this document).
2. Load version .202 or later of the codeloader program into PC.
3. Connect the USB cable [standard USB AB cable] from the USB connector to PC port.
4. Open the codeloader program up, verify that “USB” port has been selected.
5. Verify that successful communications link has been established by toggling “READ ALL”.
6. If there is no communication, key the USB RST [SW1] switch once on the board for reboot.
7. If the voltmeter monitoring function is desired, select “POLL STATUS”.
8. LDO/buck outputs may be monitored directly off the appropriate header output pins.
9. Note that for full load testing, an external PS must be connected to TP1/TP2 and jumper J1 must be removed. This is because the USB port source spec is limited to 500 mA and removing the jumper will disconnect the USB supply.
10. PWR EN/SYS En is selectable via codeloader software assignment.
11. Hardware reset can be accomplished by pressing the nREST_In momentary switch.
12. Battery backup is possible by inserting appropriate rechargeable cell into supplied holder.
13. Switches PKEY, nTJ, and SP, are provided for use in normal evaluation mode.

Powering and Jumpers Selection

The LP3972 USB evaluation platform offers several power connectors. These connectors are outlined on the table below. In addition, the Evaluation board has jumpers for special modes and stand-alone use. The default jumper settings are valid in normal operation and are also outlined below.

Component	Use	Comment
J5-1	Output for LDO1	Outside Pin of Connector is Grd
J5-2	Output for LDO2	Outside Pin of Connector is Grd
J5-3	Output for LDO3	Outside Pin of Connector is Grd
J5-4	Output for LDO4	Outside Pin of Connector is Grd
J5-6	Output for LDO5	Use LED Pad [Missed Pin]
J5-5	Output for RTC [Real time Clock]	Outside Pin of Connector is Grd
J4-1	Input for external wakeup	Outside Pin of Connector is Grd
J4-2	Output for nBATT Fault	Outside Pin of Connector is Grd
J6-2	Output for nREST	Outside Pin of Connector is Grd
J6-3	GPO 1 output	Outside Pin of Connector is Grd
J6-4	GPO 2 output	Outside Pin of Connector is Grd
J3-1	Cop8 microwire SO	Used for Micro Flash Only
J3-2	Cop8 microwire SK	Used for Micro Flash Only
J3-3	Cop8 microwire SI	Used for Micro Flash Only
J3-4	Cop 8 Grd	Used for Micro Flash Only
TP14-15	Output for switcher buck 1	GRD is TP12-13
TP19-20	Output for switcher buck 2	GRD is TP21-22
TP5-6	Output for switcher buck 3	GRD is 7-8
USB	USB connector	Connect to PC via Supplied Cable
J1	Power usage selection	Place Jumper for USB, NO JUMPER for External Power Input
TP1-2	Connect external V_{CC} supply here 3.5-5 volts for high current testing	Doubles for LI-ION Cell Input, Select Appropriate J1 Setting [2-3]

Demonstration Software Window

The demonstration software enables read and write to LP3972's internal registers through PC's USB port. All the user controllable registers are usable through the software.

Installation: Run the codeloader for LP3972 version .202 or greater.

After startup the user can verify that successful USB communication has been established by selecting "Read All", the default programmed voltages should appear.

LDO's can be enabled and disabled by clicking mouse left button on the square close to each LDO voltage slider. Changing the virtual slider changes the LDO voltage. After the WRITE button is pressed subsequent LDO changes are applied if the 'autowrite' feature is disabled.

Note 'Autowrite' enabled is default. In the case of the buck control, an option for 'hold' or 'go' can be selected. Note voltage will not change until the 'go' selection is made.

The virtual voltmeters can be activated by selecting 'Poll Status', after which an A to D conversion is read and displayed for each subsequent LDO and Buck output. Note that this feature is meant to be a general measurement and "may" be subject to variations due to operations noise. Since there is a bi-directional SDA feature, any register and its contents can be determined by entering the desired register address and selecting 'Read'. In addition, any corresponding register may be written directly to via the 'Store' selection. All virtual sliders can be updated via the 'Read All' Tab. Direct register control is possible by entering the desired address and value followed by a 'Store' command.
