Rev.2.0\_00

The S-8363 Series is a CMOS step-up switching regulator which consists of a reference voltage source, an oscillation circuit, an error amplifier, a phase compensation circuit, a current limit circuit, and a start-up circuit.

Due to the operation of the PWM / PFM switching control, pulses are skipped under the light load operation and the S-8363 Series prevents decrease in efficiency caused by IC's operating current.

The S-8363 Series is capable of start-up from 0.9 V ( $I_{OUT} = 1$  mA) by the start-up circuit, and is suitable for applications which use one dry cell.

The output voltage is freely settable from 1.8 V to 5.0 V by external parts.

Ceramic capacitors can be used for output capacitor. Small packages SNT-6A and SOT-23-6 enable high-density mounting.

### ■ Features

- Low operation voltage : Start-up from 0.9 V ( $I_{OUT} = 1$  mA) guaranteed
- Oscillation frequency : 1.2 MHz
- Input voltage range : 0.9 V to 4.5 V
- Output current : 300 mA ( $V_{IN} = 1.8$  V,  $V_{OUT} = 3.3$  V)
- Reference voltage : 0.6 V  $\pm$ 2.5%
- Efficiency : 85%
- Soft start function : 1.2 ms typ.
- Low current consumption : During switching-off, 95  $\mu$ A typ.
- Duty ratio : PWM / PFM switching control  
max.88%
- Power-off function : Current consumption during power-off 3.0  $\mu$ A max.
- Current limit circuit : limits the peak value of inductor current
- Nch power MOS FET ON resistance : 0.25  $\Omega$  typ.
- Start-up function : Operation with fixed duty pulse under the  $V_{OUT}$  voltage of 1.4 V or less
- Lead-free, Sn 100%, halogen-free<sup>\*1</sup>

\*1. Refer to "■ Product Name Structure" for details.

### ■ Applications

- MP3 players, digital audio players
- Digital cameras, GPS, wireless transceiver
- Portable devices

### ■ Packages

- SNT-6A
- SOT-23-6

■ Block Diagram

## Product Name Structure

Users can select the packages for the S-8363 Series. Refer to “1. Product name” regarding the contents of product name, “2. Package” regarding the package drawings and “3. Product list” regarding the product type.

### 1. Product name

\*1. Refer to the tape specification.

### 2. Package

Package name	Drawing code			
	Package	Tape	Reel	Land
SNT-6A	PG006-A-P-SD	PG006-A-C-SD	PG006-A-R-SD	PG006-A-L-SD
SOT-23-6	MP006-A-P-SD	MP006-A-C-SD	MP006-A-R-SD	—

### 3. Product list

Table 1

SNT-6A	SOT-23-6
S-8363B-I6T1U2	S-8363B-M6T1U2

**Remark** Please select products of environmental code = U for Sn 100%, halogen-free products.

■ Pin Configurations

Figure 2

Table 2 SNT-6A

Pin No.	Symbol	Description
1	FB	Output voltage feedback pin
2	VSS	GND pin
3	CONT	External inductor connection pin
4	VIN	IC power supply pin
5	VOUT	Output voltage pin
6	ON/ $\overline{\text{OFF}}$	Power-off pin "H" : Power-on (normal operation) "L" : Power-off (standby)

Figure 3

Table 3 SOT-23-6

Pin No.	Symbol	Description
1	ON/ $\overline{\text{OFF}}$	Power-off pin "H" : Power-on (normal operation) "L" : Power-off (standby)
2	VOUT	Output voltage pin
3	VIN	IC power supply pin
4	CONT	External inductor connection pin
5	VSS	GND pin
6	FB	Output voltage feedback pin

■ Absolute Maximum Ratings

Table 4 Absolute Maximum Ratings

(Ta = +25°C, VSS = 0 V unless otherwise specified)

Item	Symbol	Absolute Maximum Ratings	Unit
VIN pin voltage	VIN	VSS-0.3 to VSS+5.0	V
VOU pin voltage	VOU	VSS-0.3 to VSS+6.0	V
FB pin voltage	VFB	VSS-0.3 to VOUT+0.3	V
CONT pin voltage	VCONT	VSS-0.3 to VSS+6.0	V
ON/OFF pin voltage	VON/OFF	VSS-0.3 to VIN+0.3	V
Power Dissipation	SNT-6A	400*1	mW
	SOT-23-6	650*1	mW
Operating ambient temperature	Topr	-40 to +85	°C
Storage temperature	Tstg	-40 to +125	°C

\*1. When mounted on board

[Mounted board]

- (1) Board size : 114.3 mm × 76.2 mm × t1.6 mm
- (2) Name : JEDEC STANDARD51-7

**Caution** The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

## ■ Operation

### 1. Switching control method

The S-8363 Series switching regulator automatically switches between the pulse width modulation method (PWM) and pulse frequency modulation method (PFM) according to the load current.

A low ripple power can be supplied by operating on PWM control for which the pulse width changes up to 88% in the range where the output load current is large.

The S-8363 Series operates on PFM control when the output load current is small and the pulses are skipped according to the amount of the load current. Therefore, the oscillation circuit intermittently oscillates, reducing the self-current consumption. This prevents decrease in efficiency when the output load current is small. The ripple voltage during the PFM control is very small, so that the S-8363 Series realizes high efficiency and the low-noise power supply.

The point at which PWM control switches to PFM control varies depending on the external element (inductor, diode, etc.), input voltage value, and output voltage value, and this method achieves high efficiency in the output load current of about 100  $\mu$ A.

## 2. Low voltage start-up

### 2.1 Start-up circuit

The S-8363 Series can startup from 0.9 V. When the  $V_{OUT}$  voltage at  $ON/\overline{OFF} = "H"$  does not reach the STU release voltage, the start-up circuit starts the operation and outputs the fixed duty pulse to the CONT pin. By this, the  $V_{OUT}$  voltage starts step-up. After that, the  $V_{OUT}$  voltage reaches the STU release voltage and the STU mode circuit is set in STU release condition, therefore, the switching control circuit starts stable operation due to the soft-start function. Simultaneously, the start-up circuit is set in disable condition, so that the S-8363 Series prevents excessive current consumption.

### 2.2 Start-up mode (STU mode) circuit

The STU mode circuit monitors the  $V_{OUT}$  voltage, and switches the operation modes between start-up period and normal control period of the switching control circuit. The STU release voltage is internally fixed at 1.4 V (typ.), and has hysteresis of approx. 0.15 V. When the  $V_{OUT}$  voltage decreases to 1.25 V (typ.) from release condition, the STU mode circuit is set in the STU detection condition, shifting to the start-up period. Several  $\mu s$  to several ten  $\mu s$  is taken to shift from STU release to PWM release. During this the step-up operation is not performed, therefore, the  $V_{OUT}$  voltage may largely decrease depending on the size of load.

During applying  $ON/\overline{OFF} = "L"$ , the STU mode circuit is set in disable condition, so that the S-8363 Series prevents excessive current consumption.

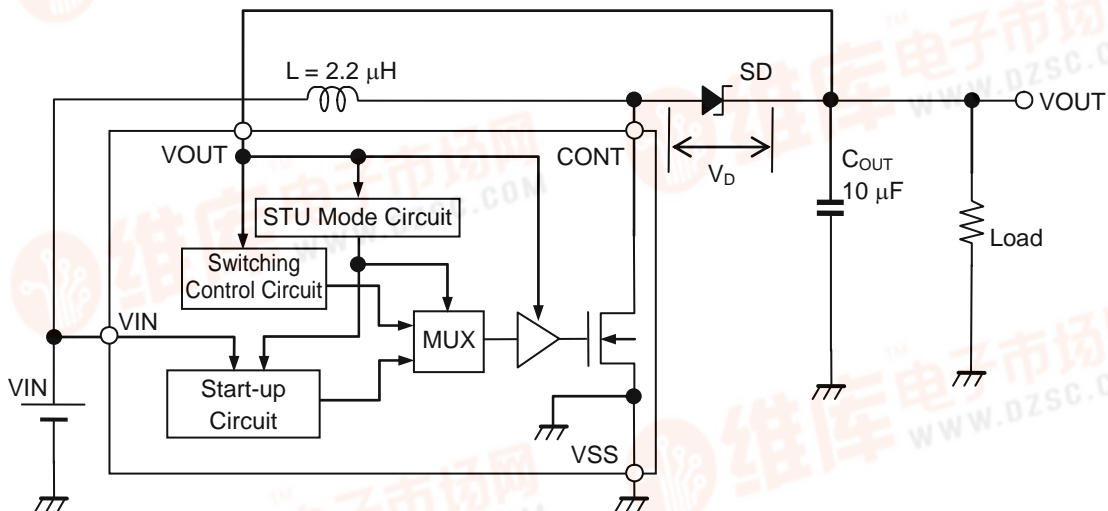

Figure 8 Start-up Circuit

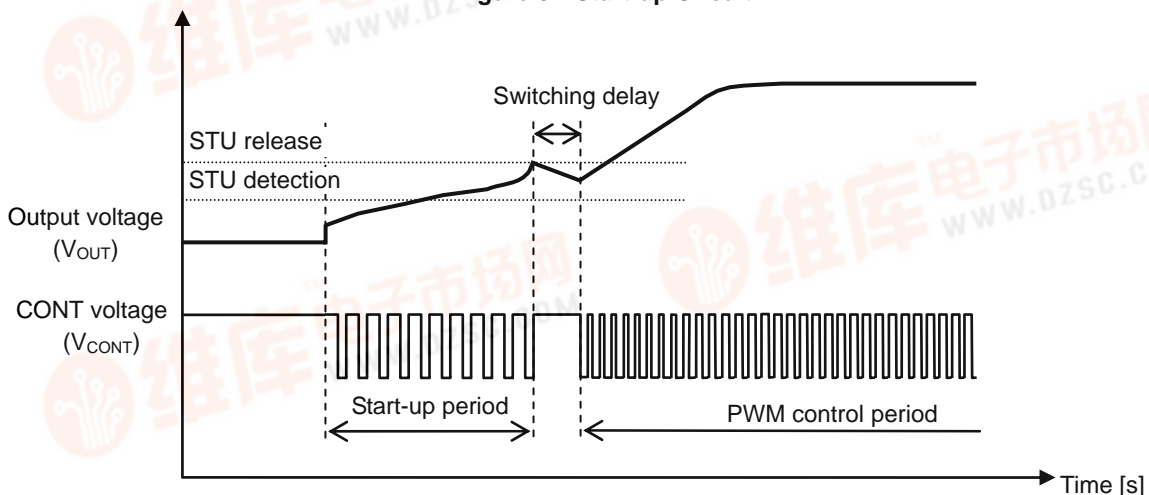

Figure 9 Start-up Sequence

### 2.3 Schottky barrier diode

A schottky barrier diode (SD) is necessary to operate the S-8363 Series. The VOUT pin also works as the power supply pin. The voltage applied on the VOUT pin when ON/OFF = "L" is  $V_{IN} - V_D$ .  $V_D$  is forward voltage for step-down of SD, and largely varies depending on the forward current  $I_f$  of SD and ambient temperature, but  $V_d$  is approx. 0.2 V to 0.5 V.

When the S-8363 Series startups from 0.9 V, use a SD with specially low  $V_D$ . When using CRS08 for the S-8363 Series, start-up is guaranteed when  $T_a = +25^\circ\text{C}$  and a load current of 1 mA.

Satisfy the following conditions when using other SDs.

- Low forward voltage ( $V_D$ )
- High switching speed
- Reverse withstand voltage of  $V_{OUT} +$  spike voltage or more
- Rated current of  $I_{PK}$  or more

Table 7 Typical Schottky Diodes

Manufacturer	Name
TOSHIBA CORPORATION	CRS02
	CRS08
ROHM Co., Ltd.	RB161M-20TR
	RB051LA-40TR
	RB070M-30TR
	RB161SS-20T2R

**Remark** Generally, in diodes with low forward voltage  $V_D$ , reverse leakage current  $I_r$  tends to increase. Especially, increase of  $I_r$  in high temperature is significant. To prevent decrease in efficiency, choose a diode with low  $I_r$  when low voltage start-up is unnecessary.

### 3. Soft-start function

The S-8363 Series has the built-in soft-start circuit. When power-on (connecting ON/OFF to  $V_{IN}$ ) or after start-up at ON/OFF = "H", the output voltage ( $V_{OUT}$ ) gradually rises, suppressing rush current and overshoot of the output voltage. In the S-8363 Series, the soft-start time ( $t_{ss}$ ) is from start-up to the time to reach 90% of the  $V_{OUT}$  output voltage setting value ( $V_{OUT(S)}$ ). A reference voltage adjustment method is adopted as the soft-start method, the reference voltage gradually rises from 0 V simultaneously with start of the soft-start. The soft-start circuit has two operation modes which is selected according to the  $V_{OUT}$  voltage at start-up.

#### 3.1 $V_{OUT}$ voltage at start-up > STU release voltage

The soft-start starts when the reference voltage gradually rises after ON/OFF = "H".

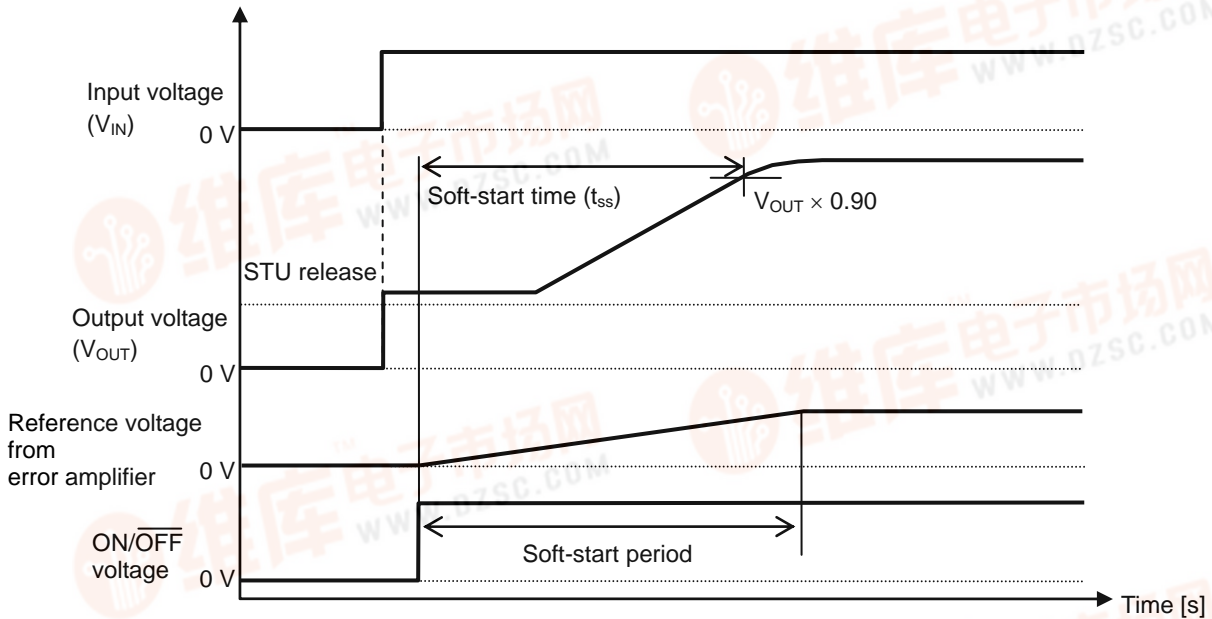

Figure 10

3.2  $V_{OUT}$  voltage at start-up < STU release voltage

After  $\overline{ON/OFF}$  = "H", step-up starts by the start-up operation. When the  $V_{OUT}$  voltage reaches the STU release voltage, the soft-start starts.

Since the length of the start-up period largely varies depending on the input voltage, load current, external parts and ambient temperature, the soft-start time varies according to them. Perform sufficient evaluation with actual application.

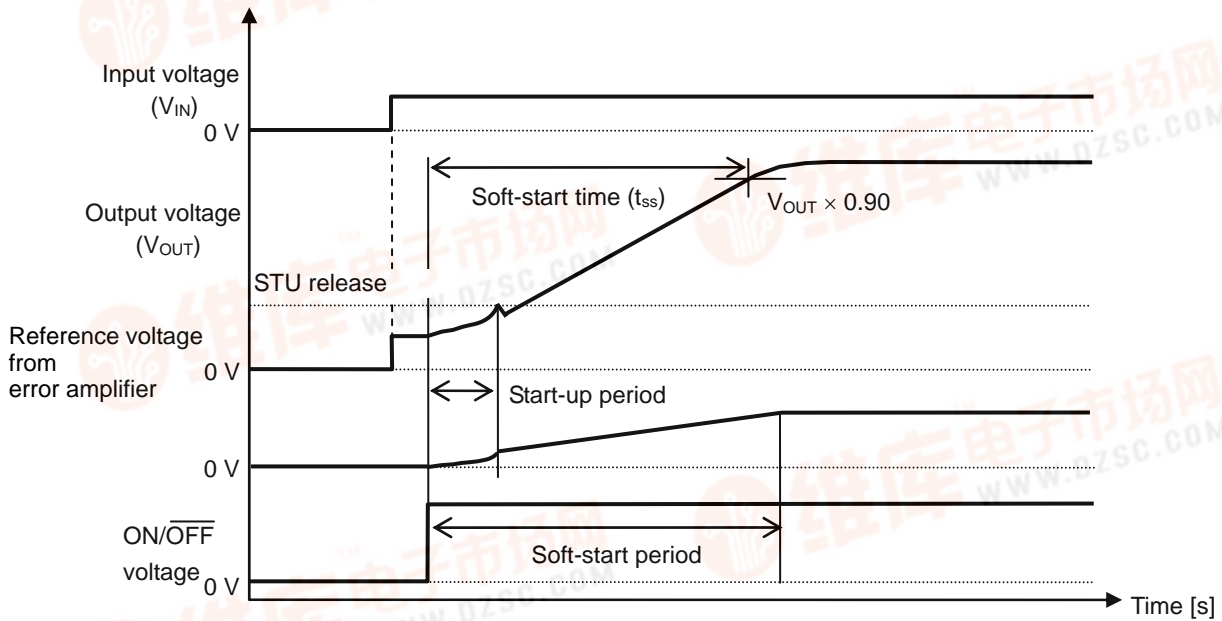

Figure 11

### 3.3 Condition of performing soft-start again

The condition to reset after the reference voltage once rises (reference voltage from error amplifier = 0 V) is to set the ON/OFF pin voltage to "L". Setting ON/OFF = "H" starts soft-start again. When the  $V_{OUT}$  voltage drops and decreases more than the STU detection voltage by an overload, the soft-start circuit shifts to the start-up period. When the  $V_{OUT}$  voltage is restored by releasing overload, the soft-start function is performed. If the  $V_{OUT}$  voltage is not decreased less than the STU detection voltage, the soft-start function is not performed when restoration.

Figure 12 Reset Condition for Soft-Start

#### 4. Power-off pin

This pin stops or starts step-up operations.

When the ON/ $\overline{\text{OFF}}$  pin is set to the low level, the internal driver of the CONT pin is turned off and all internal circuits stop substantially reducing the current consumption.

The ON/ $\overline{\text{OFF}}$  pin is set up as shown in **Figure 13** and is internally pulled down by using the depression transistor, so all circuits stop even if this pin is floating. Do not apply a voltage of between 0.25 V and 0.75 V to the ON/ $\overline{\text{OFF}}$  pin because applying such a voltage increases the current consumption. If the ON/ $\overline{\text{OFF}}$  pin is not used, connect it to the VIN pin.

Table 8

ON/ $\overline{\text{OFF}}$ pin	CR oscillation circuit	Output voltage
"H"	Operates	Set value
"L"	Stops	$V_{\text{IN}} - V_{\text{D}}$

Figure 13

#### 5. Current limit circuit

A current limit circuit is built in the S-8363 Series.

The current limit circuit monitors the current that flows in the Nch power MOS FET and limits current in order to prevent thermal destruction of the IC due to an overload or magnetic saturation of the inductor.

When a current exceeding the current limit detection value flows in the Nch power MOS FET, the current limit circuit operates and turns off the Nch power MOS FET since the current limit detection until one clock of the oscillator ends. The Nch power MOS FET is turned on in the next clock and the current limit circuit resumes current detection operation. If the value of the current that flows in the Nch power MOS FET remains the current limit detection value or more, the current limit circuit functions again and the same operation is repeated. Once the value of the current that flows in the Nch power MOS FET is lowered up to the specified value, the normal operation status restores.

The current limit detection value is fixed to 1.1 A (typ.) in the IC. However, under the condition that ON duty is small, between the detection delay time of the current limit circuit and the ON time of the Nch power MOS FET, the difference is small. Therefore, the current value which is actually limited is increased. Usually, when the difference between the VIN pin and VOUT pin is small, on duty is decreased and the limited current value is increased.

## ■ Operation Principles

The S-8363 Series is a step-up switching regulator. **Figure 14** shows the basic circuit diagram.

Step-up switching regulators start current supply by the input voltage ( $V_{IN}$ ) when the Nch power MOS FET is turned on and holds energy in the inductor at the same time. When the Nch power MOS FET is turned off, the CONT pin voltage is stepped up to discharge the energy held in the inductor and the current is discharged to  $V_{OUT}$  through the diode. When the discharged current is stored in  $C_{OUT}$ , a voltage is generated, and the potential of  $V_{OUT}$  increases until the voltage of the FB pin reaches the same potential as the internal reference voltage.

For the PWM control method, the switching frequency ( $f_{OSC}$ ) is fixed and the  $V_{OUT}$  voltage is held constant according to the ratio of the ON time and OFF time (ON duty) of the Nch power MOS FET in each period.

In the PWM control method, the  $V_{OUT}$  voltage is held constant by controlling the ON time.

In the PFM control method, the Nch power MOS FET is turned on by fixed duty. When energy is discharged to  $V_{OUT}$  once and the  $V_{OUT}$  potential exceeds the set value, the Nch power MOS FET stays in the off status until  $V_{OUT}$  decreases to the set value or less due to the load discharge. Time  $V_{OUT}$  decreases to the set value or less depends on the amount of load current, so, the switching frequency varies depending on this current.

**Figure 14 Basic Circuit of Step-up Switching Regulator**

The ON duty in the current continuous mode can be calculated by using the equation below. Use the S-8363 Series in the range where the ON duty is less than the maximum duty.

The maximum duty is 88% (typ.).

$$\text{ON duty} = \left( 1 - \frac{V_{IN}}{V_{OUT} + V_D} \right) \times 100 [\%]$$

\*1.  $V_D$  : Forward voltage of diode

1. Continuous current mode

The following explains the current that flows into the inductor when the step-up operation stabilizes in a certain status and I<sub>OUT</sub> is sufficiently large.

When the Nch power MOS FET is turned on, current (I<sub>1</sub>) flows in the direction shown in **Figure 14**. The inductor current (I<sub>L</sub>) at this time gradually increases in proportion with the ON time (t<sub>ON</sub>) of the Nch power MOS FET, as shown in **Figure 15**.

Current change of inductor within t<sub>ON</sub> :

$$\begin{aligned} \Delta I_{L(ON)} &= I_L \text{ max.} - I_L \text{ min.} \\ &= \frac{V_{IN}}{L} \times t_{ON} \end{aligned}$$

When the Nch power MOS FET is turned off, the voltage of the CONT pin is stepped up to V<sub>OUT</sub> + V<sub>D</sub> and the voltage on both ends of the inductor becomes V<sub>OUT</sub> + V<sub>D</sub> - V<sub>IN</sub>. However, it is assumed here that V<sub>OUT</sub> >> V<sub>D</sub> and V<sub>D</sub> is ignored.

Current change of inductor within t<sub>OFF</sub> :

$$\Delta I_{L(OFF)} = \frac{V_{OUT} - V_{IN}}{L} \times t_{OFF}$$

The input power equals the output power in an ideal situation where there is no loss by components.

I<sub>IN(AV)</sub> :

$$\begin{aligned} P_{IN} &= P_{OUT} \\ I_{IN(AV)} \times V_{IN} &= I_{OUT} \times V_{OUT} \\ \therefore I_{IN(AV)} &= \frac{V_{OUT}}{V_{IN}} \times I_{OUT} \dots\dots\dots (1) \end{aligned}$$

The current that flows in the inductor consists of a ripple current that changes due to variation over time and a direct current.

From **Figure 15** :

$$\begin{aligned} I_{IN(AV)} &: \\ I_{IN(AV)} &= I_{IN(DC)} + \frac{\Delta I_L}{2} \\ &= I_{IN(DC)} + \frac{V_{OUT} - V_{IN}}{2 \times L} \times t_{OFF} \\ &= I_{IN(DC)} + \frac{V_{IN}}{2 \times L} \times t_{ON} \dots\dots\dots (2) \end{aligned}$$

Above, the continuous mode is the operation mode when I<sub>IN(DC)</sub> > 0 as shown in **Figure 15** and the inductor current continuously flows.

While the output current (I<sub>OUT</sub>) continues to decrease, I<sub>IN(DC)</sub> reaches 0 as shown in **Figure 16**. This point is the critical point of the continuous mode.

As shown in equations (1) and (2), the direct current component (I<sub>IN(DC)</sub>) depends on I<sub>OUT</sub>.

I<sub>OUT(0)</sub> when I<sub>IN(DC)</sub> reaches 0 (critical point) :

$$I_{OUT(0)} = \frac{t_{ON} \times V_{IN}^2}{2 \times L \times V_{OUT}}$$

When the output current decreases below I<sub>OUT(0)</sub>, the current flowing in the inductor stops flowing in the t<sub>OFF</sub> period as shown in **Figure 17**. This is the discontinuous mode.

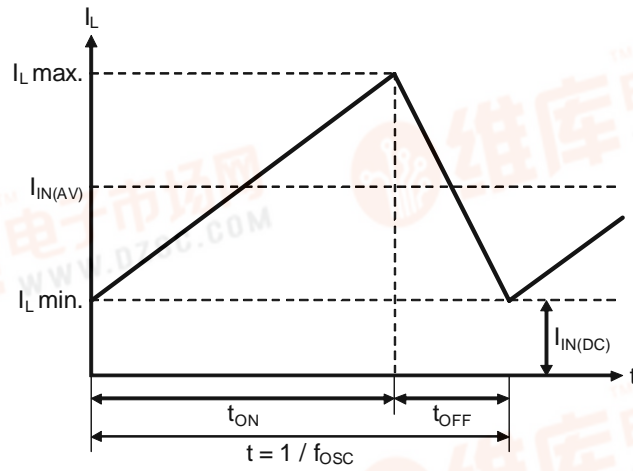

Figure 15 Continuous Mode (Current Cycle of Inductor Current  $I_L$ )

Figure 16 Critical Point (Current Cycle of Inductor Current  $I_L$ )

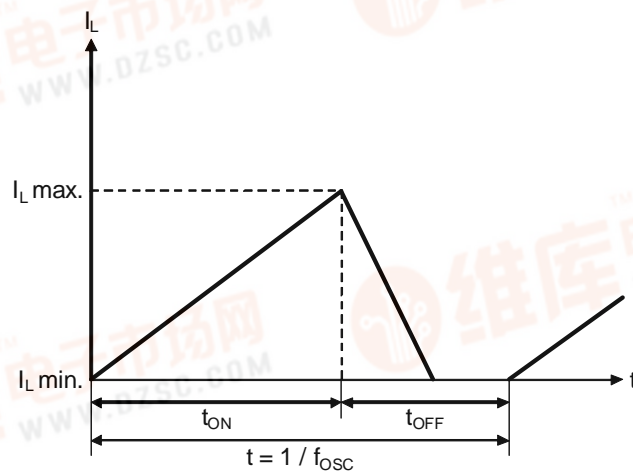

Figure 17 Discontinuous Mode (Current Cycle of Inductor Current  $I_L$ )

■ External Parts Selection

1. Inductor

The recommended L value of the S-8363 Series is 2.2 μH.

**Caution** When selecting an inductor, be careful about its allowable current. If a current exceeding the allowable current flows through the inductor, magnetic saturation occurs, substantially lowering the efficiency and destroying ICs due to large current. Therefore, select an inductor such that  $I_{PK}$  does not exceed the allowable current. The following equations express  $I_{PK}$  in the ideal statuses in the discontinuous and continuous modes :

$$I_{PK} = \sqrt{\frac{2 \times I_{OUT} \times (V_{OUT} + V_D^{*2} - V_{IN})}{f_{OSC}^{*1} \times L}} \quad (\text{Discontinuous mode})$$

$$I_{PK} = \frac{V_{OUT} + V_D^{*2}}{V_{IN}} \times I_{OUT} + \frac{(V_{OUT} + V_D^{*2} - V_{IN}) \times V_{IN}}{2 \times (V_{OUT} + V_D^{*2}) \times f_{OSC}^{*1} \times L} \quad (\text{Continuous mode})$$

\*1.  $f_{OSC}$  : oscillation frequency

\*2.  $V_D$  is the forward voltage of a diode. The reference value is 0.4 V.

However, current exceeding the above equation flows because conditions are practically not ideal. Perform sufficient evaluation with actual application.

Table 9 Typical Inductors

Manufacturer	Name	L value	Direct resistor	Rated current	Size (L × W × H) [mm]
TDK Corporation	VLF302510-2R2M	2.2 μH	0.084 Ω max.	1.23 A max.	3.0 × 2.5 × 1.0
	VLS3010T-2R2M	2.2 μH	0.116 Ω max.	1.2 A max.	3.0 × 3.0 × 1.0
	VLS201610E	2.2 μH	0.276 Ω max.	0.94 A max.	2.0 × 1.6 × 0.95
	MLP2012S2R2M	2.2 μH	0.300 Ω max.	0.8 A max.	2.0 × 1.25 × 1.0
Coilcraft, Inc	LPS3010-222ML	2.2 μH	0.220 Ω max.	1.3 A max.	3.0 × 3.0 × 1.0
Murata Manufacturing Co., Ltd.	LQM2HPN2R2MG0	2.2 μH	0.080 Ω ± 25%	1.3 A max.	2.5 × 2.0 × 1.0

	NR4010T2R2N	2.2 μH	0.180 Ω max.	1.15 A max.	4.0 × 4.0 × 1.0
	BRL2518T2R2M	2.2 μH	0.1755 Ω max.	0.85 A max.	2.5 × 1.8 × 1.2

## 2. Diode

Use an externally mounted that meets the following conditions.

- Low forward voltage (Schottky barrier diode or similar types)
- High switching speed
- Reverse withstand voltage of  $V_{OUT}$  + spike voltage or more
- Rated current of  $I_{PK}$  or more

## 3. Input capacitor ( $C_{IN}$ ) and output capacitor ( $C_{OUT}$ )

To improve efficiency, an input capacitor ( $C_{IN}$ ) lowers the power supply impedance and averages the input current. Select  $C_{IN}$  according to the impedance of the power supply used. The recommended capacitance is 1  $\mu$ F or more for the S-8363 Series.

An output capacitor ( $C_{OUT}$ ), which is used to smooth the output voltage, requires a capacitance larger than that of the step-down type because the current is intermittently supplied from the input to the output side in the step-up type. When the output voltage is low or the load current is large, enlarging an output capacitance value is required. Moreover, when the output voltage is high, connecting a 0.1  $\mu$ F ceramic capacitor in parallel is required. Mount near a  $V_{OUT}$  pin as possible.

The indication of an output capacitor to the setting value of  $V_{OUT}$  voltage is shown in the **table 10**. Perform thorough evaluation using an actual application to set the constant when selecting parts.

A ceramic capacitor can be used for both the input and output.

**Table 10 Recommended Output Capacitance**

$V_{OUT}$ voltage	Output capacitor ( $C_{OUT}$ )
< 2.5 V	10 $\mu$ F $\times$ 2
2.5 V to 4.0 V	10 $\mu$ F
4.0 V <	10 $\mu$ F + 0.1 $\mu$ F

#### 4. Output voltage setting resistors ( $R_{FB1}$ , $R_{FB2}$ ), capacitor for phase compensation ( $C_{FB}$ )

For the S-8363 Series,  $V_{OUT}$  can be set to any value by using external divider resistors. Connect the divider resistors between the VOUT and VSS pins.

Because  $V_{FB} = 0.6$  V typ.,  $V_{OUT}$  can be calculated by using the following equation :

$$V_{OUT} = \frac{R_{FB1} + R_{FB2}}{R_{FB2}} \times 0.6$$

Connect divider resistors  $R_{FB1}$  and  $R_{FB2}$  as close to the IC as possible to minimize the effects of noise. If noise has an effect, adjust the values of  $R_{FB1}$  and  $R_{FB2}$  so that  $R_{FB1} + R_{FB2} < 100$  k $\Omega$ .

$C_{FB}$ , which is connected in parallel with  $R_{FB1}$ , is a capacitor for phase compensation.

By setting the zero point (the phase feedback) by adding capacitor  $C_{FB}$  to output voltage setting resistor  $R_{FB1}$  in parallel, the phase margin increases, improving the stability of the feedback loop. To effectively use the feedback portion of the phase based on the zero point, define  $C_{FB}$  by using the following equation :

$$C_{FB} \cong \frac{\sqrt{L} \times C_{OUT}}{3 \times R_{FB1}} \times \frac{V_{OUT}}{V_{DD}}$$

This equation is only a guide.

The following explains the optimum setting.

To efficiently use the feedback portion of the phase based on the zero point, specify settings so that the phase feeds back at the zero point frequency ( $f_{zero}$ ) of  $R_{FB1}$  and  $C_{FB}$  according to the phase delay at the pole frequency ( $f_{pole}$ ) of L and  $C_{OUT}$ . The zero point frequency is generally set slightly higher than the pole frequency.

The following equations are used to determine the pole frequency of L and  $C_{OUT}$  and the zero point frequency set using  $R_{FB1}$  and  $C_{FB}$ .

$$f_{pole} \cong \frac{1}{2 \times \pi \times \sqrt{L} \times C_{OUT}} \times \frac{V_{DD}}{V_{OUT}}$$

$$f_{zero} \cong \frac{1}{2 \times \pi \times R_{FB1} \times C_{FB}}$$

The transient response can be improved by setting the zero point frequency in a lower frequency range. If, however, the zero point frequency is set in a significantly lower range, the gain increases in the range of high frequency and the phase margin decreases. This might result in unstable operation. Determine the proper value after sufficient evaluation with actual application.

The typical constants based on our evaluation are shown in **Table 11**.

**Table 11 Example of Constant for External Parts**

$V_{OUT(S)}$ [V]	$V_{IN}$ [V]	$R_{FB1}$ [k $\Omega$ ]	$R_{FB2}$ [k $\Omega$ ]	$C_{FB}$ [pF]
1.8	1.2	30	15	82
2.48	1.2	47	15	68
3.32	1.8	68	15	47
4.2	1.8	90	15	39
5.0	1.8	110	15	39

## Standard Circuit

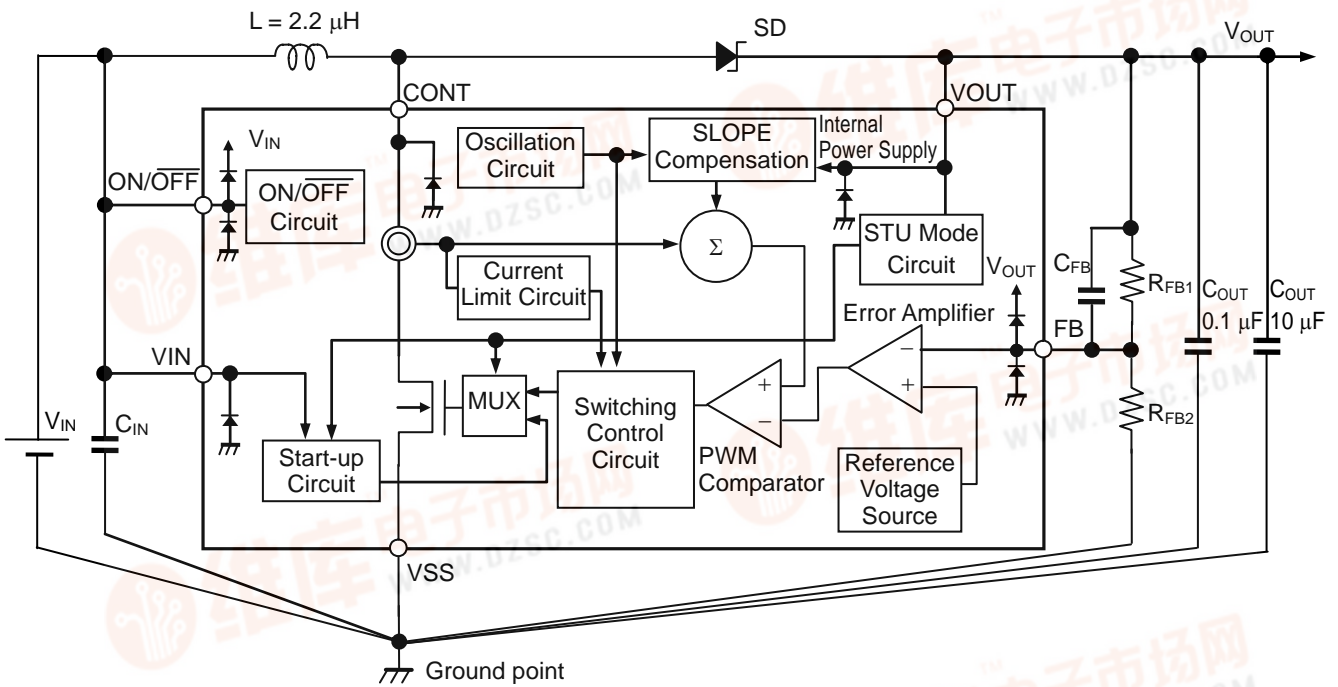

Figure 18

**Caution** The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using an actual application to set the constants.

## Precaution

- Mount external capacitors and inductor as close as possible to the IC. Set single point ground.
- Characteristics ripple voltage and spike noise occur in IC containing switching regulators. Moreover rush current flows at the time of a power supply injection. Because these largely depend on the inductor, the capacitor and impedance of power supply used, perform sufficient evaluation with actual application.
- The 0.1  $\mu\text{F}$  capacitor connected between the VOUT and VSS pins is a bypass capacitor. It stabilizes the power supply in the IC when application is used with a heavy load, and thus effectively works for stable switching regulator operation. Allocate the bypass capacitor as close to the IC as possible, prioritized over other parts.
- Although the IC contains a static electricity protection circuit, static electricity or voltage that exceeds the limit of the protection circuit should not be applied.
- The power dissipation of the IC greatly varies depending on the size and material of the board to be connected. Perform sufficient evaluation using an actual application before designing.
- SII claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

## Application Circuits

Application circuits are examples. They may always not guarantee successful operation.

### 1. External parts for application circuits

Table 12 Characteristics of External Parts

Part	Part Name	Manufacturer	Characteristics
Inductor	VLF302510	TDK Corporation	2.2 $\mu$ H, DCR <sup>*1</sup> = 0.084 $\Omega$ , I <sub>MAX</sub> <sup>*2</sup> = 1.23 A, L × W × H = 3.0 × 2.5 × 1.0 mm

## ■ Characteristics (Typical Data)

### 1. Examples of Major Power Supply Dependence Characteristics (Ta = +25°C)

(1) Current consumption during operation ( $I_{IN1}$ ) vs. Operating input voltage ( $V_{IN}$ )  
 Current consumption during switching off ( $I_{IN2}$ ) vs. Operating input voltage ( $V_{IN}$ )

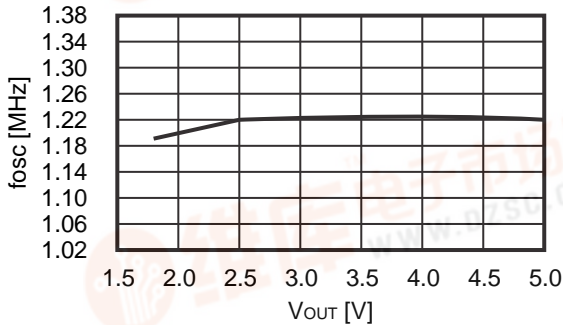

(2) Current consumption during operation ( $I_{SS1}$ ) vs. Output voltage ( $V_{OUT}$ )  
 Current consumption during switching off ( $I_{SS2}$ ) vs. Output voltage ( $V_{OUT}$ )

(3) Current consumption during power-off ( $I_{SSS}$ ) vs. Operating input voltage ( $V_{IN}$ ), Output voltage ( $V_{OUT}$ )

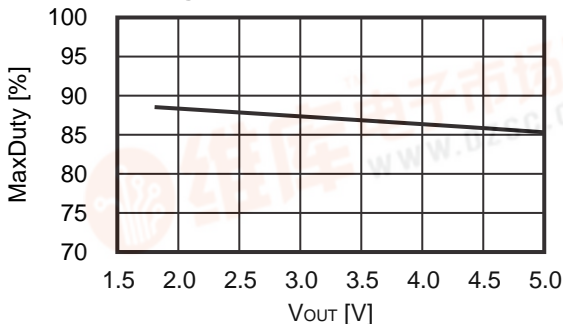

(4) Oscillation frequency ( $f_{OSC}$ ) vs. Output voltage ( $V_{OUT}$ )

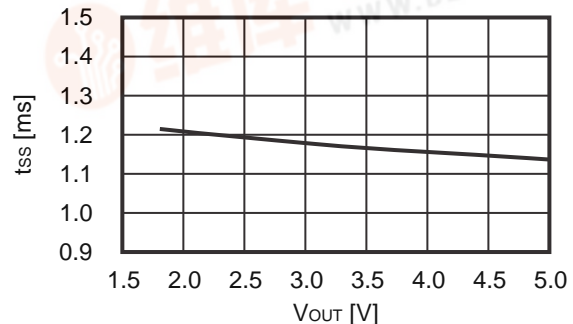

(5) Start-up oscillation frequency ( $f_{ST}$ ) vs. Operating input voltage ( $V_{IN}$ )

(6) Maximum duty ratio (MaxDuty) vs. Output voltage ( $V_{OUT}$ )

(7) Soft-start time ( $t_{SS}$ ) vs. Output voltage ( $V_{OUT}$ )

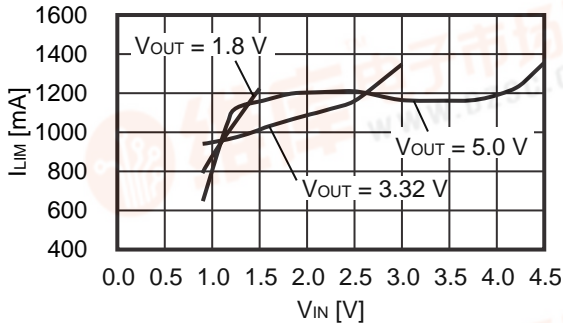

(8) PWM / PFM switching duty ratio (PFMDuty) vs. Operating input voltage ( $V_{IN}$ )

(9) Output current at PWM / PFM switching ( $I_{PFM}$ ) vs. Operating input voltage ( $V_{IN}$ )

(10) Limited current ( $I_{LIM}$ ) vs. Operating input voltage ( $V_{IN}$ )

(11) Maximum load current ( $I_{OUTMAX}$ ) vs. Operating input voltage ( $V_{IN}$ )

(12) Power MOS FET leakage current ( $I_{LSW}$ ) vs. Output voltage ( $V_{OUT}$ )

(13) High level input voltage ( $V_{SH}$ ) vs. Operating input voltage ( $V_{IN}$ )

(14) Low level input voltage ( $V_{SL}$ ) vs. Operating input voltage ( $V_{IN}$ )

(15) FB voltage ( $V_{FB}$ ) vs. Output voltage ( $V_{OUT}$ )

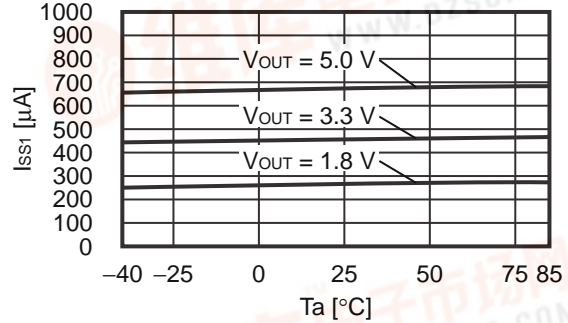

2. Examples of Major Temperature Characteristics (Ta = -40 to +85°C)

(1) Current consumption during operation (I<sub>IN1</sub>) vs. Temperature (Ta)

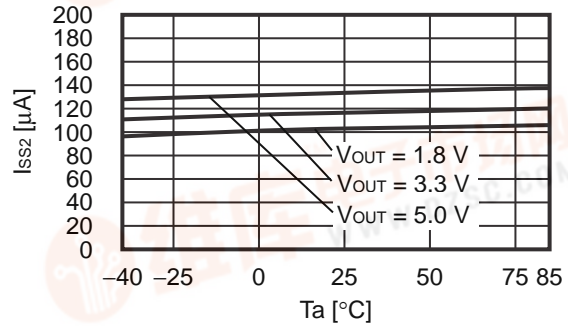

(2) Current consumption during operation (I<sub>SS1</sub>) vs. Temperature (Ta)

(3) Current consumption during switching off (I<sub>IN2</sub>) vs. Temperature (Ta)

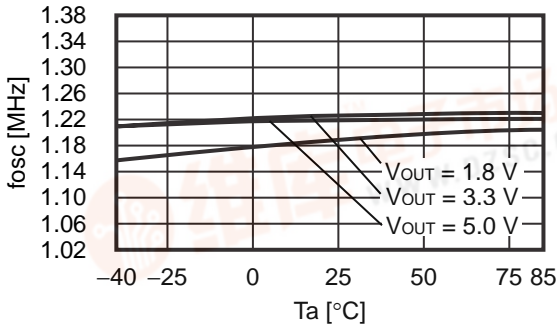

(4) Current consumption during switching off (I<sub>SS2</sub>) vs. Temperature (Ta)

(5) Current consumption during power-off (I<sub>SSS</sub>) vs. Temperature (Ta)

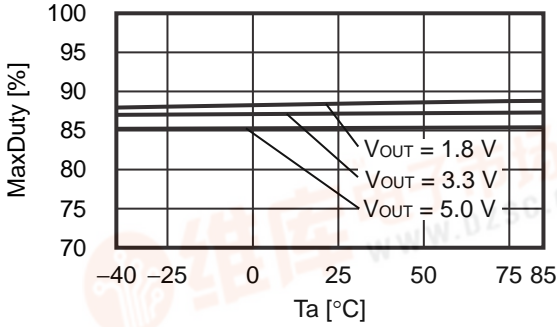

(6) Oscillation frequency (f<sub>OSC</sub>) vs. Temperature (Ta)

(7) Start-up oscillation frequency (f<sub>ST</sub>) vs. Temperature (Ta)

(8) Maximum duty ratio (MaxDuty) vs. Temperature (Ta)

(9) Soft-start time (t<sub>SS</sub>) vs. Temperature (Ta)

(10) PWM / PFM switching duty ratio (PFMDuty) vs. Temperature (Ta)

(11) Output current at PWM / PFM switching (I<sub>PFM</sub>) vs. Temperature (Ta)

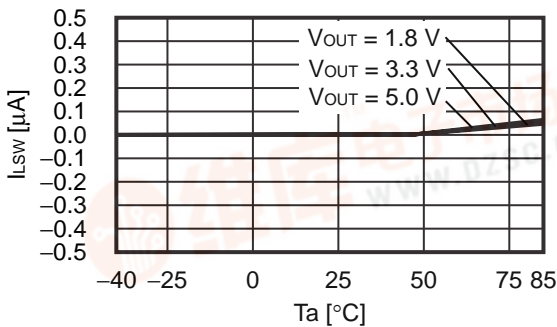

(12) Limited current (I<sub>LIM</sub>) vs. Temperature (Ta)

(13) Maximum load current (I<sub>OUTMAX</sub>) vs. Temperature (Ta)

(14) Power MOS FET leakage current (I<sub>LSW</sub>) vs. Temperature (Ta)

(15) High level input voltage (V<sub>SH</sub>) vs. Temperature (Ta)

(16) Low level input voltage ( $V_{SL}$ ) vs Temperature ( $T_a$ )

(17) FB voltage ( $V_{FB}$ ) vs. Temperature ( $T_a$ )

(18) Operating start voltage ( $V_{ST}$ ) vs. Temperature ( $T_a$ )

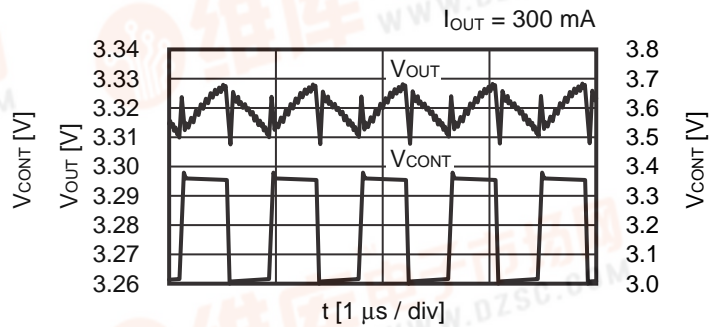

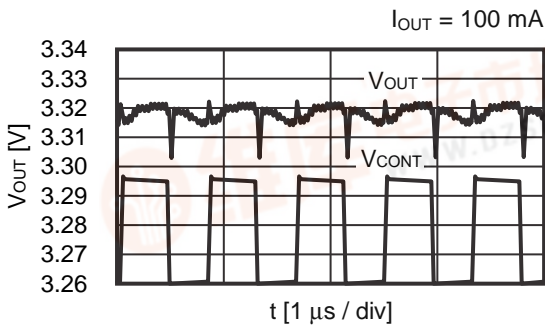

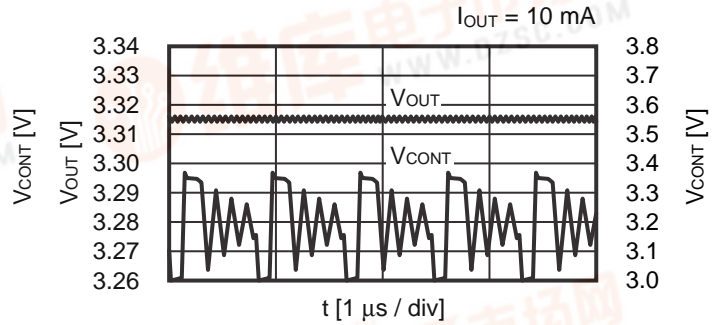

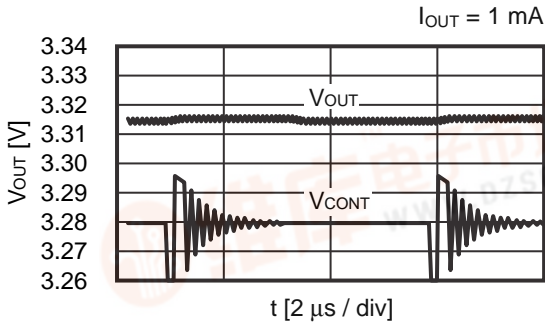

(19) Start-up mode release voltage ( $V_{STU+}$ ) vs. Temperature ( $T_a$ )

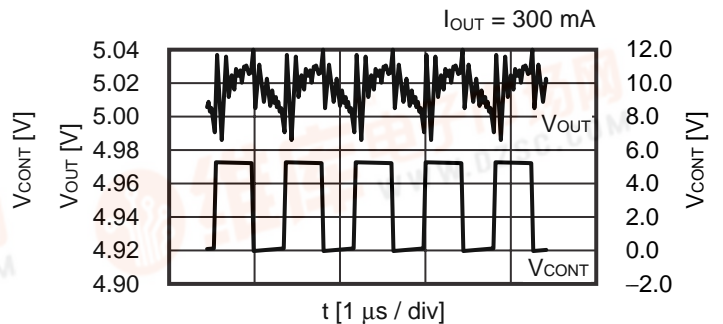

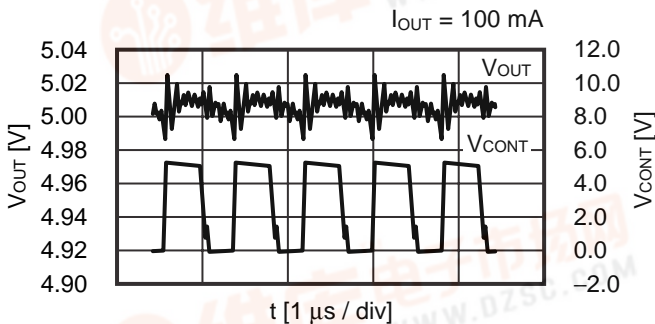

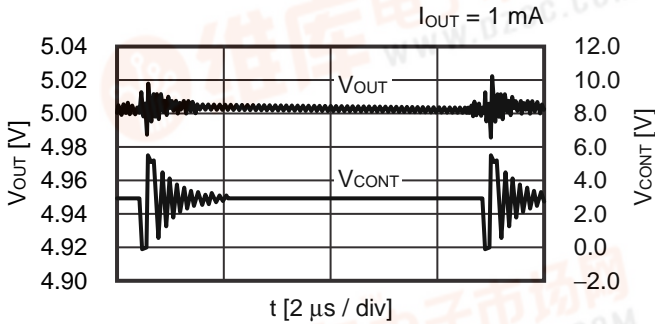

3. Output waveform

(1)  $V_{OUT} = 3.3\text{ V}$  ( $V_{IN} = 1.98\text{ V}$ )

(2)  $V_{OUT} = 5.0\text{ V}$  ( $V_{IN} = 3.0\text{ V}$ )

#### 4. Examples of Transient Response Characteristics

Unless otherwise specified, the used parts are those in **Table 6 External Parts List**.

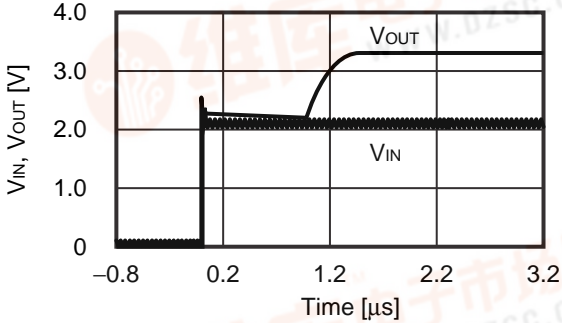

##### 4.1 At power-on ( $V_{OUT(S)} = 3.3\text{ V}$ , $V_{IN} = 0\text{ V} \rightarrow 0.9\text{ V}$ , $T_a = +25^\circ\text{C}$ )

###### (1) $I_{OUT} = 1\text{ mA}$

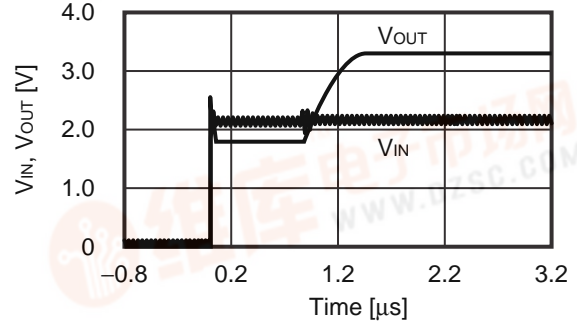

##### 4.2 At power-on ( $V_{OUT(S)} = 3.3\text{ V}$ , $V_{IN} = 0\text{ V} \rightarrow 2.0\text{ V}$ , $T_a = +25^\circ\text{C}$ )

###### (1) $I_{OUT} = 1\text{ mA}$

###### (2) $I_{OUT} = 300\text{ mA}$

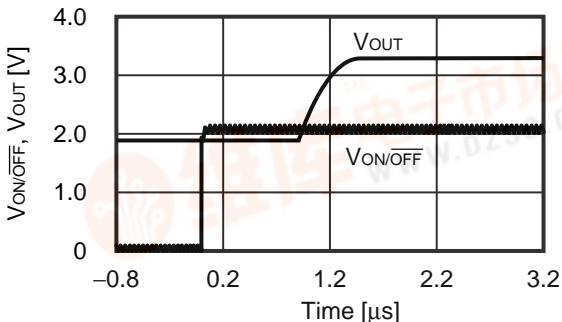

##### 4.3 Power-off pin response ( $V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 0.9\text{ V}$ , $V_{ON/OFF} = 0\text{ V} \rightarrow 0.9\text{ V}$ , $T_a = +25^\circ\text{C}$ )

###### (1) $I_{OUT} = 1\text{ mA}$

##### 4.4 Power-off pin response ( $V_{OUT} = 3.3\text{ V}$ , $V_{IN} = 2.0\text{ V}$ , $V_{ON/OFF} = 0\text{ V} \rightarrow 2.0\text{ V}$ , $T_a = +25^\circ\text{C}$ )

###### (1) $I_{OUT} = 1\text{ mA}$

###### (2) $I_{OUT} = 300\text{ mA}$

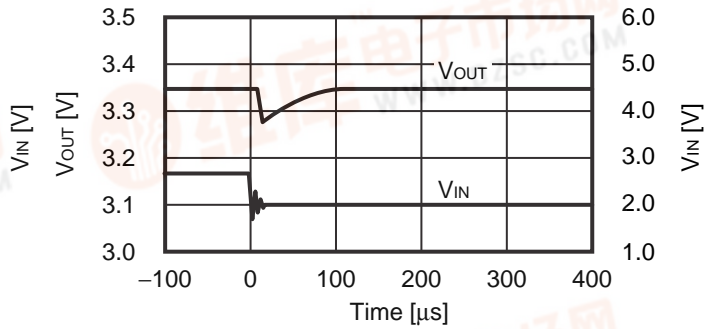

4.5 Power supply voltage fluctuations ( $V_{OUT} = 3.0\text{ V}$ ,  $I_{OUT} = 100\text{ mA}$ ,  $T_a = +25^\circ\text{C}$ )

(1)  $V_{IN} = 1.98\text{ V} \rightarrow 2.64\text{ V}$

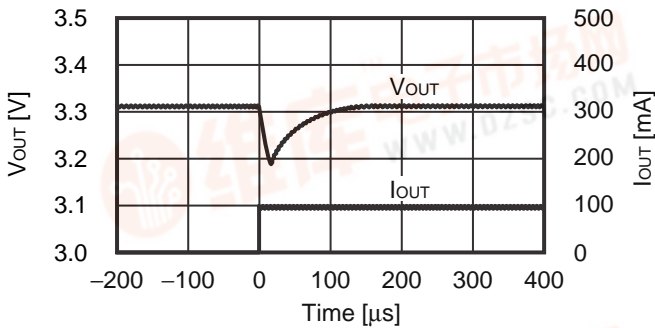

(2)  $V_{IN} = 2.64\text{ V} \rightarrow 1.98\text{ V}$

4.6 Load fluctuations ( $V_{OUT} = 3.3\text{ V}$ ,  $V_{IN} = 1.98\text{ V}$ ,  $I_{OUT} = 0.1\text{ mA} \rightarrow 100\text{ mA} \rightarrow 0.1\text{ mA}$ ,  $T_a = +25^\circ\text{C}$ )

(1)  $I_{OUT} = 0.1\text{ mA} \rightarrow 100\text{ mA}$

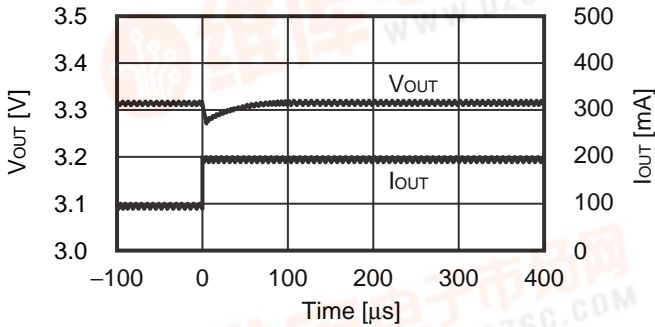

(2)  $I_{OUT} = 100\text{ mA} \rightarrow 0.1\text{ mA}$

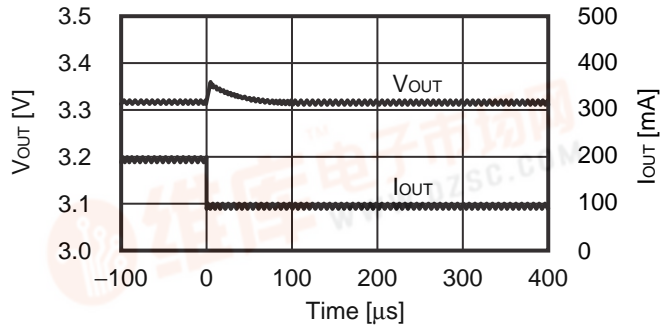

4.7 Load fluctuations ( $V_{OUT} = 3.3\text{ V}$ ,  $V_{IN} = 1.98\text{ V}$ ,  $I_{OUT} = 100\text{ mA} \rightarrow 200\text{ mA} \rightarrow 100\text{ mA}$ ,  $T_a = +25^\circ\text{C}$ )

(1)  $I_{OUT} = 100\text{ mA} \rightarrow 200\text{ mA}$

(2)  $I_{OUT} = 200\text{ mA} \rightarrow 100\text{ mA}$

■ Reference Data

Reference data is provided to determine specific external components. Therefore, the following data shows the characteristics of the recommended external components selected for various applications.

1. External parts

Table 15 Efficiency vs. Output Current Characteristics and Output Voltage vs. Output Current Characteristics for External Parts (1 / 2)

**Caution** The values shown in the characteristics column of Table 16 above are based on the materials provided by each manufacture. However, consider the characteristics of the original materials when using the above products.

## 2. Output Current ( $I_{OUT}$ ) vs. Efficiency ( $\eta$ ) Characteristics, Output Current ( $I_{OUT}$ ) vs. Output Voltage ( $V_{OUT}$ ) Characteristics

Following shows the actual output current ( $I_{OUT}$ ) vs. efficiency ( $\eta$ ) and output current ( $I_{OUT}$ ) vs. output voltage ( $V_{OUT}$ ) characteristics for conditions 1 to 7 in Table 15.

### Condition 1 S-8363B ( $V_{OUT(S)} = 1.8 \text{ V}$ )

### Condition 2 S-8363B ( $V_{OUT(S)} = 3.3 \text{ V}$ )

### Condition 3 S-8363B ( $V_{OUT(S)} = 5.0 \text{ V}$ )

### Condition 4 S-8363B ( $V_{OUT(S)} = 3.3 \text{ V}$ )

Condition 5 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )

Condition 6 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )

Condition 7 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )

### 3. Output Current ( $I_{OUT}$ ) vs. Ripple Voltage ( $V_r$ ) Characteristics

Following shows the actual output current ( $I_{OUT}$ ) vs. ripple voltage ( $V_r$ ) characteristics for conditions of 1 to 7 in Table 15.

**Condition 1 S-8363B ( $V_{OUT(S)} = 1.8\text{ V}$ )**

**Condition 2 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )**

**Condition 3 S-8363B ( $V_{OUT(S)} = 5.0\text{ V}$ )**

**Condition 4 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )**

**Condition 5 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )**

**Condition 6 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )**

**Condition 7 S-8363B ( $V_{OUT(S)} = 3.3\text{ V}$ )**

■ Marking Specification

(1) SNT-6A

(1) to (3) :  
 (4) to (6) :

Product code (Refer to Product name vs. Product code)  
 Lot number

Product name vs. Product code

Product name	Product code		
	(1)	(2)	(3)
S-8363B-I6T1U2	I	9	B

(2) SOT-23-6

(1) to (3) :  
 (4) :

Product code (Refer to Product name vs. Product code)  
 Lot number

Product name vs. Product code

Product name	Product code		
	(1)	(2)	(3)
S-8363B-M6T1U2	I	9	B

**Remark** Please select products of environmental code = U for Sn 100%, halogen-free products.

**Caution** Making the wire pattern under the package is possible. However, note that the package may be upraised due to the thickness made by the silk screen printing and of a solder resist on the pattern because this package does not have the standoff.

**注意** パッケージ下への配線パターン形成は可能ですが、本パッケージはスタンドオフが無いので、パターン上のレジスト厚み、シルク印刷の厚みによってパッケージが持ち上がる場合がありますのでご配慮ください。
