

0.8 μ A Low Power Consumption Dual Voltage Regulator

GENERAL DESCRIPTION

The XC6411/XC6412 series is a dual LDO regulator manufactured using CMOS process. The series achieves very low supply current 0.8 μ A typical by channel and consists of a reference voltage source, an error amplifier, a current foldback circuit, and a phase compensation circuit plus a driver transistor. The XC6411P series in SOT-25 packages, the XC6412B series in SOT-26 packages make high density mounting possible. Therefore, the series is ideally suited for applications where high density mounting is required such as mobile equipment.

Each output voltage of two regulators VR1 and VR2 is selectable in 0.1V increments within a range of 0.9V to 5.0V by laser trimming. The series is compatible with low ESR ceramic capacitors, which provides stable outputs. The VR1 and VR2 are completely isolated so that a cross talk during load fluctuation is minimized. The current limiter's foldback circuit also operates as a short protection for the output pin.

APPLICATIONS

- MP3 players, Portable AV equipment
- Mobile phones
- Cordless phones,
Wireless communication equipment
- Portable games
- Cameras, Video recorders
- PDAs

FEATURES

- Maximum Output Current** : 200mA (300mA Limit TYP.)
@ $V_{OUT}=3.0V$, $V_{IN}=4.0V$
- Dropout Voltage** : 320mV @ $I_{OUT} = 100mA$
@ $V_{OUT} = 3.0V$
- Input Voltage Range** : 1.5V ~ 6.0V
- Output Voltage Range** : 0.9V ~ 5.0V (0.1V increments)
- Highly Accurate** : $\pm 2\%$ ($1.5 < V_{OUT(T)} \leq 5.0V$)
 $\pm 0.03V$ ($0.9 \leq V_{OUT(T)} \leq 1.5V$)
- Low Power Consumption** : 0.8 μ A / ch.(TYP.)
- Operating Temperature Range** : - 40°C ~ 85°C
- Low ESR Capacitor Compatible**: Ceramic capacitor
- Current Limiter Circuit Built-In**
- Small Packages** : SOT-25 (XC6411P)
: SOT-26 (XC6412B)

TYPICAL APPLICATION CIRCUIT

TYPICAL PERFORMANCE CHARACTERISTICS

- Supply Current vs. Input Voltage

VR1/VR2: 3.0V

$C_{IN}=1.0\mu F$ (ceramic), $C_L=0.1\mu F$ (ceramic)

OPERATIONAL EXPLANATION

<Output Voltage Control>

The voltage, divided by resistors R11 & R12 for a regulator 1 and R21 & R22 for a regulator 2 is compared with the internal reference voltage by the error amplifier. These resistors are connected to the VOUT pin. The P-channel MOSFET connected to the VOUT pin is then driven by the subsequent output signal. The output voltage at the VOUT pin is controlled and stabilized by a system of negative feedback. The current limit circuit operates when the load current reaches the current limit level.

* Diodes shown in the above circuit are ESD protection diodes and parasitic diodes.

<Dual Inputs>

In the XC6411P series, the two input voltage pins are separated. The two regulators 1 and 2 can operate independently so that it offers design flexibility.

<Short Protection Circuit>

The XC6411P/6412 series' regulator offers short-circuit protection by means of a built-in foldback circuit. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. As a result of this drop in output voltage, the foldback circuit operates, the output voltage drops further and output current decreases. When the output voltage pin is shorted, a current of about 50mA flows.

<EN2 Pin>

The regulator 2's internal circuitry can be operated or shutdown via the signal from the EN2 pin with the XC6412 series. In so doing the regulator 1 maintains an operational state constantly. In shutdown mode, output at the VOUT2 pin will be pulled down to the Vss level via R21 & R22. Note that the XC6412 series' regulator is "High Active/No Pull-Down", operations will become unstable with the EN2 pin open. We suggest that you use this IC with either a VIN voltage or a Vss voltage input at the EN2 pin. If this IC is used with the correct specifications for the EN pin, the operational logic is fixed and the IC will operate normally. However, supply current may increase as a result of through current in the IC's internal circuitry.

NOTES ON USE

1. Please use this IC within the stated absolute maximum ratings. The IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current.
3. As for the XC6412 series, internally achieved phase compensation makes a stable operation of the IC possible even when there is no output capacitor (CL). In order to stabilize the VIN's voltage level, we recommend that an input capacitor (CIN) of about 0.1 to 1.0 μ F be connected between each VIN pin and the Vss pin. Moreover, during transient response, so as to prevent an undershoot or overshoot, we recommend that the output capacitor (CL) of about 0.1 to 1.0 μ F be connected between each VOUT pin and the Vss pin. However, please wire the input capacitor (CIN) and the output capacitor (CL) as close to the IC as possible.
