

# CRYSTAL-TO-MLVDS PCI EXPRESS™ CLOCK SYNTHESIZER W/SPREAD SPECTRUM

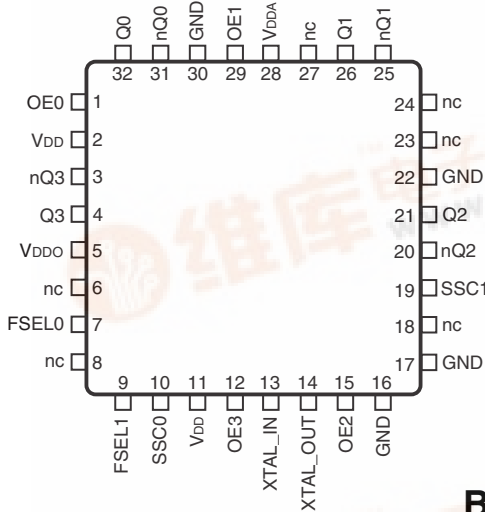

**ICS845204**

## General Description

The ICS845204 is a 4 output PCI Express clock synthesizer optimized to generate low jitter PCI Express™ reference clocks with or without spread spectrum modulation and is a member of the HiPerClockS™ family of high performance clock solutions from IDT. Spread type and amount can be configured via the SSC control pins. Using a 25MHz, 18pF parallel resonant crystal, the device will generate M-LVDS clocks at either 25MHz, 100MHz, 125MHz or 250MHz. The ICS845204 uses a low jitter VCO that easily meets PCI Express jitter requirements and is packaged in a 32-pin VFQFN package.

## Features

- Four differential spread spectrum clock outputs
- Each output can be individually disabled by separate output-enable inputs
- Crystal oscillator interface designed for 18pF, 25MHz parallel resonant crystal
- Supports the following output frequencies: 25MHz, 100MHz, 125MHz or 250MHz
- VCO range: 250MHz - 700MHz
- Supports SSC downspread at 0.05% and -0.75%, centerspread at ±0.25% and no spread options
- Cycle-to-cycle jitter: 50ps (maximum) design target
- Period jitter, RMS: TBD
- Full 3.3V output supply mode
- 0°C to 70°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages

## Block Diagram

The Advance Information presented herein represents a product that is developmental or prototype. The noted characteristics are design targets. Integrated Device Technologies, Inc. (IDT) reserves the right to change any circuitry or specifications without notice.

[查询"845204AK"供应商](#)**Table 1. Pin Descriptions**

Number	Name	Type		Description
1	OE0	Input	Pullup	Output enable pin for Q0/nQ0 outputs. Logic High, outputs are enabled. Logic LOW, outputs are in Hi-Z. LVCMOS/LVTTL interface levels.
2, 11	V <sub>DD</sub>	Power		Core supply pins.
3, 4	nQ3, Q3	Output		Differential output pair. M-LVDS interface levels.
5	V <sub>DDO</sub>	Power		Output supply pin.
6, 8, 18, 23, 24, 27	nc	Unused		No connect.
7	FSEL0	Input	Pullup	Output frequency select pins. See Table 3A. LVCMOS/LVTTL interface levels.
9	FSEL1	Input	Pulldown	Output frequency select pin. See Table 3A. LVCMOS/LVTTL interface levels.
10, 19	SSC0, SSC1	Input	Pullup	Spread spectrum control pins. See Table 3B. LVCMOS/LVTTL interface levels.
12	OE3	Input	Pullup	Output enable pin for Q3/nQ3 outputs. Logic High, outputs are enabled. Logic LOW, outputs are in Hi-Z. LVCMOS/LVTTL interface levels.
13, 14	XTAL_IN XTAL_OUT	Input		Crystal oscillator interface. XTAL_IN is the input, XTAL_OUT is the output.
15	OE2	Input	Pullup	Output enable pin for Q2/nQ2 outputs. Logic High, outputs are enabled. Logic LOW, outputs are in Hi-Z. LVCMOS/LVTTL interface levels.
16, 17, 22, 30	GND	Power		Power supply ground.
20, 21	nQ2, Q2	Output		Differential output pair. M-LVDS interface levels.
25, 26	nQ1, Q1	Output		Differential output pair. M-LVDS interface levels.
28	V <sub>DDA</sub>	Power		Analog supply pin.
29	OE1	Input	Pullup	Output enable pin for Q1/nQ1 outputs. Logic High, outputs are enabled. Logic LOW, outputs are in Hi-Z. LVCMOS/LVTTL interface levels.
31, 32	nQ0, Q0	Output		Differential output pair. M-LVDS interface levels.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

**Table 2. Pin Characteristics**

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C <sub>IN</sub>	Input Capacitance			4		pF
R <sub>PULLUP</sub>	Input Pullup Resistor			51		kΩ
R <sub>PULLDOWN</sub>	Input Pulldown Resistor			51		kΩ

## Function Tables

Table 3A. F\_SEL[1:0] Function Table

Inputs		Outputs
FSEL1	FSEL0	Q[0:3]/nQ[0:3]
0	0	PLL Bypass (25MHz)
0	1	100MHz (default)
1	0	125MHz
1	1	250MHz

Table 3B. SSC[1:0] Function Table

Inputs		Spread%
SSC1	SSC0	
0	0	Center $\pm$ -0.25
0	1	Down -0.5
1	0	Down -0.75
1	1	No Spread (default)

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, $V_{DD}$	4.6V
Inputs, $V_I$	-0.5V to $V_{DD} + 0.5V$
Outputs, $I_O$ Continuous Current Surge Current	10mA 15mA
Package Thermal Impedance, $\theta_{JA}$	42.4°C/W (0 mps)
Storage Temperature, $T_{STG}$	-65°C to 150°C

## DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics,  $V_{DD} = V_{DDO} = 3.3V \pm 5\%$ ,  $T_A = 0^\circ C$  to  $70^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$V_{DD}$	Core Supply Voltage		3.135	3.3	3.465	V
$V_{DDA}$	Analog Supply Voltage		$V_{DD} - I_{DDA} * 10\Omega$	3.3	$V_{DD}$	V
$V_{DDO}$	Output Supply Voltage		3.135	3.3	3.465	V

## AC Electrical Characteristics

Table 6. AC Characteristics,  $V_{DD} = V_{DDO} = 3.3V \pm 5\%$ ,  $T_A = 0^\circ C$  to  $70^\circ$

Parameter	Symbol	Test Conditions	Minimum	Typical	Maximum	Units
$f_{OUT}$	Output Frequency			25		MHz
				100		MHz
				125		MHz
$f_{jit(per)}$	Period Jitter, Random	25MHz, Integration Range: 12kHz – 20MHz		TBD		ps
		100MHz, Integration Range: 12kHz – 20MHz		TBD		ps
		125MHz, Integration Range: 12kHz – 20MHz		TBD		ps
		250MHz, Integration Range: 12kHz – 20MHz		TBD		ps
$f_{jit(cc)}$	Cycle-to-Cycle Jitter; NOTE 1, 2	25MHz			50	ps
		100MHz			50	ps
		125MHz			50	ps
		250MHz			50	ps
$t_{sk(o)}$	Output Skew; NOTE 2, 3			TBD		ps
$F_{XTAL}$	Crystal Input Range: NOTE 1			25		MHz
$F_M$	SSC Modulation Frequency; NOTE 4			TBD		kHz
$F_{MF}$	SSC Modulation Factor; NOTE 4			TBD		%
$SSC_{RED}$	Spectral Reduction			TBD		dB
$t_{STABLE}$	Power-up Stable Clock Output				10	ms
$t_R / t_F$	Output Rise/Fall Time	20% to 80%		TBD		ps
odc	Output Duty Cycle			50		%

NOTE 1: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 2: Only valid within the VCO operating range.

NOTE 3: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at the output differential cross points.

NOTE 4: Spread Spectrum clocking enabled.

## Application Information

### Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS845204 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{DD}$ ,  $V_{DDA}$  and  $V_{DDO}$  should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a  $10\Omega$  resistor along with a  $10\mu\text{F}$  and a  $0.01\mu\text{F}$  bypass capacitor should be connected to each  $V_{DDA}$  pin.

Figure 1. Power Supply Filtering

## Recommendations for Unused Input and Output Pins

### Inputs:

#### LVC MOS Control Pins

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A  $1\text{k}\Omega$  resistor can be used.

### Outputs:

#### M-LVDS Outputs

All unused M-LVDS output pairs can be either left floating or terminated with  $100\Omega$  across. If they are left floating, there should be no trace attached.

[查询“845204AK”供应商](#)

## Crystal Input Interface

The ICS845204 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 25MHz, 18pF parallel

resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

**Figure 2. Crystal Input Interface**

## LVC MOS to XTAL Interface

The XTAL\_IN input can accept a single-ended LVC MOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 3*. The XTAL\_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVC MOS inputs, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output

impedance of the driver ( $R_o$ ) plus the series resistance ( $R_s$ ) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First,  $R_1$  and  $R_2$  in parallel should equal the transmission line impedance. For most 50Ω applications,  $R_1$  and  $R_2$  can be 100Ω. This can also be accomplished by removing  $R_1$  and making  $R_2$  50Ω.

## VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 4*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are

application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

### 3.3V M-LVDS Driver Termination

A general M-LVDS interface is shown in *Figure 5*. In a  $100\Omega$  differential transmission line environment, M-LVDS drivers require a matched load termination of  $100\Omega$  across near the receiver input.

For a multiple M-LVDS outputs buffer, if only partial outputs are used, it is recommended to terminate the unused outputs.

Figure 5. Typical M-LVDS Driver Termination
