

High-voltage high and low side driver

Preliminary Data

Features

- High voltage rail up to 600 V
- dV/dt immunity ± 50 V/nsec in full temperature range
- Driver current capability:
 - 270 mA source
 - 430 mA sink
- Switching times 75/35 nsec rise/fall with 1 nF load
- 3.3 V, 5 V TTL/CMOS inputs with hysteresis
- Integrated bootstrap diode
- Operational amplifier for advanced current sensing
- Adjustable dead-time
- Interlocking function
- Compact and simplified layout
- Bill of material reduction
- Flexible, easy and fast design

Description

The L6392 is a high-voltage device, manufactured with the BCD "OFF-LINE" technology. It has a monolithic half-bridge gate driver for N-channel Power MOSFET or IGBT.

The high side (floating) section is designed to stand a voltage rail up to 600 V. The logic inputs are CMOS/TTL compatible down to 3.3 V for easy of interfacing microcontroller/DSP

The IC embeds an op amp suitable for advanced current sensing in applications such as field oriented motor control.

Application

Table 1. Device summary

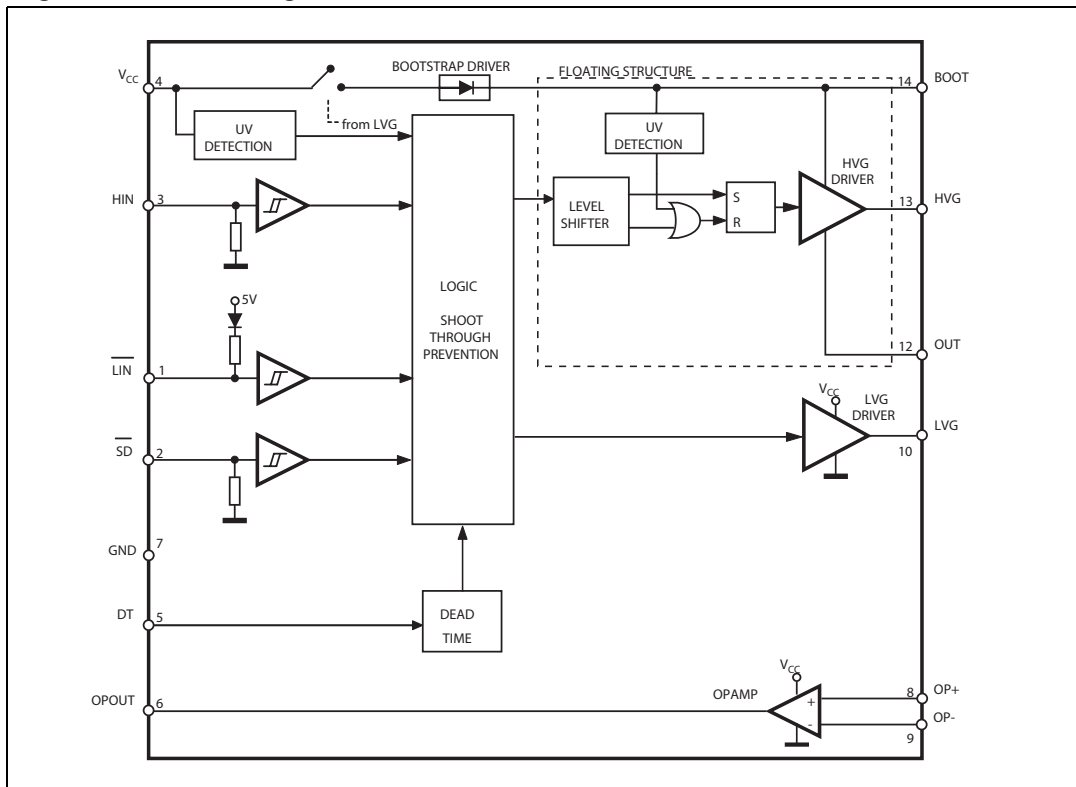

Order codes	Package	Packaging
L6392	DIP-14	Tube
L6392D	SO-14	Tube

1 Block diagram

Figure 1. Block diagram

2 Pin connection

Figure 2. Pins connection (top view)

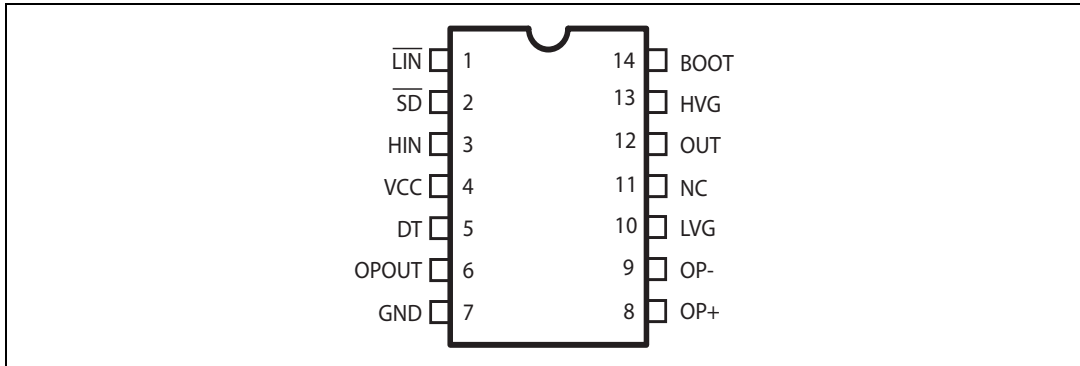

Table 2. Pin description

Pin N#	Pin name	Type	Function
1	$\overline{\text{LIN}}$	I	Low side driver logic input (active low)
2	$\overline{\text{SD}}^{(1)}$	I	Shut down logic input (active low)
3	HIN	I	High side driver logic input (active high)
4	VCC	P	Lower section supply voltage
5	DT	I	Dead time setting
6	OPOUT	O	Opamp output
7	GND	P	Ground
8	OP+	I	Opamp non inverting input
9	OP-	I	Opamp inverting input
10	LVG ⁽¹⁾	O	Low side driver output
11	NC		Not connected
12	OUT	P	High side (floating) common voltage
13	HVG ⁽¹⁾	O	High side driver output
14	BOOT	P	Bootstrapped supply voltage

1. The circuit guarantees less than 1 V on the LVG and HVG pins (@ $I_{\text{sink}} = 10 \text{ mA}$), with $V_{\text{CC}} > 3 \text{ V}$. This allows to omitting the "bleeder" resistor connected between the gate and the source of the external MOSFET normally used to hold the pin low; the gate driver assures low impedance also in SD condition.

4 Electrical data

4.1 Absolute maximum ratings

Table 4. Absolute maximum rating

Symbol	Parameter	Value	Unit
V _{out}	Output voltage	V _{boot} -21 to V _{boot} +0.3	V
V _{CC}	Supply voltage	- 0.3 to + 21	V
V _{op+}	Opamp non-inverting input	-0.3 to V _{CC} +0.3	V
V _{op-}	Opamp inverting input	-0.3 to V _{CC} +0.3	V
V _{boot}	Floating supply voltage	V _{CC} - 0.3 to 620	V
V _{hvg}	High side gate output voltage	V _{out} - 0.3 to V _{boot} + 0.3	V
V _{lvg}	Low side gate output voltage	-0.3 to V _{CC} + 0.3	V
V _i	Logic input voltage	-0.3 to 15	V
dV _{out} /dt	Allowed output slew rate	50	V/ns
P _{tot}	Total power dissipation (T _A = 85 °C)	TBD	mW
T _J	Junction temperature	150	°C
T _{stg}	Storage temperature	-50 to 150	°C

Note: ESD immunity for pins 12, 13 and 14 is guaranteed up to TBD (Human Body Model)

4.2 Thermal data

Table 5. Thermal data

Symbol	Parameter	SO-14	DIP-14	Unit
R _{th(JA)}	Thermal resistance junction to ambient	165	100	°C/W

4.3 Recommended operating conditions

Table 6. Recommended operating conditions

Symbol	Pin	Parameter	Test condition	Min	Max	Unit
V _{out}	12	Output voltage ⁽¹⁾			580	V
V _{BS} ⁽²⁾	14	Floating supply voltage ⁽¹⁾		TBD	TBD	V
f _{sw}		Switching frequency	HVG, LVG load C _L = 1nF		800	kHz
V _{CC}	4	Supply voltage		TBD	TBD	V
T _J		Junction temperature		-40	125	°C

1. If the condition TBDV < V_{boot} - V_{out} < TBD V and V_{boot} < TBD V are guaranteed, V_{out} can range from TBD V to 580 V.

2. V_{BS} = V_{boot} - V_{out}

7 Typical application diagram

Figure 5. Application diagram

8 Bootstrap driver

A bootstrap circuitry is needed to supply the high voltage section. This function is normally accomplished by a high voltage fast recovery diode (*Figure 6 a*). In the L6392 a patented integrated structure replaces the external diode. It is realized by a high voltage DMOS, driven synchronously with the low side driver (LVG), with diode in series, as shown in *Figure 6 b*.

An internal charge pump (*Figure 6 b*) provides the DMOS driving voltage.

8.1 C_{BOOT} selection and charging

To choose the proper C_{BOOT} value the external MOS can be seen as an equivalent capacitor. This capacitor C_{EXT} is related to the MOS total gate charge:

$$C_{EXT} = \frac{Q_{gate}}{V_{gate}}$$

The ratio between the capacitors C_{EXT} and C_{BOOT} is proportional to the cyclical voltage loss. It has to be:

$$C_{BOOT} \gg \gg C_{EXT}$$

e.g.: if Q_{gate} is 30 nC and V_{gate} is 10 V, C_{EXT} is 3 nF. With C_{BOOT} = 100 nF the drop would be 300 mV.

If HVG has to be supplied for a long time, the C_{BOOT} selection has to take into account also the leakage and quiescent losses.

e.g.: HVG steady state consumption is lower than 200 μA, so if HVG T_{ON} is 5 ms, C_{BOOT} has to supply 1 μC to C_{EXT}. This charge on a 1 μF capacitor means a voltage drop of 1 V.

The internal bootstrap driver gives a great advantage: the external fast recovery diode can be avoided (it usually has great leakage current).

This structure can work only if V_{OUT} is close to GND (or lower) and in the meanwhile the LVG is on. The charging time (T_{charge}) of the C_{BOOT} is the time in which both conditions are fulfilled and it has to be long enough to charge the capacitor.

The bootstrap driver introduces a voltage drop due to the DMOS R_{DSON} (typical value: 120 Ω). At low frequency this drop can be neglected. Anyway increasing the frequency it must be taken in to account.

The following equation is useful to compute the drop on the bootstrap DMOS:

$$V_{drop} = I_{charge} R_{dson} \rightarrow V_{drop} = \frac{Q_{gate}}{T_{charge}} R_{dson}$$

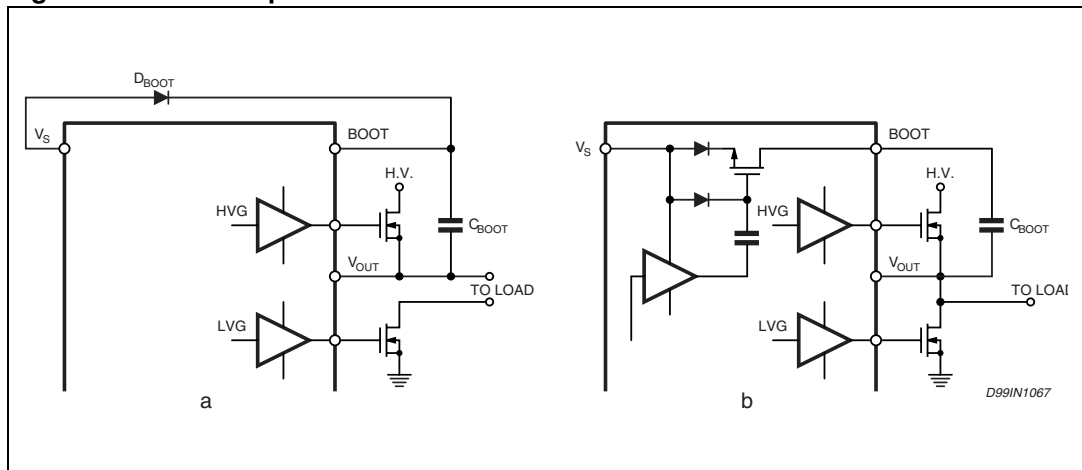

where Q_{gate} is the gate charge of the external power MOS, R_{dson} is the on resistance of the bootstrap DMOS, and T_{charge} is the charging time of the bootstrap capacitor.

For example: using a power MOS with a total gate charge of 30 nC the drop on the bootstrap DMOS is about 1 V, if the T_{charge} is 5 μs . In fact:

$$V_{\text{drop}} = \frac{30\text{nC}}{5\mu\text{s}} \cdot 120\Omega \sim 0.7\text{V}$$

V_{drop} has to be taken into account when the voltage drop on C_{BOOT} is calculated: if this drop is too high, or the circuit topology doesn't allow a sufficient charging time, an external diode can be used.

Figure 6. Bootstrap driver

9 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect . The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com
