

## LP39542

# Advanced Lighting Management Unit

## General Description

LP39542 is an advanced lighting management unit for handheld devices. It drives any phone lights including display backlights, RGB, keypad and camera flash LEDs. The boost DC-DC converter drives high current loads with high efficiency. White LED backlight drivers are high efficiency low voltage structures with excellent matching and automatic fade in/ fade out function. The stand-alone command based RGB controller is feature rich and easy to configure. Built-in audio synchronization feature allows user to synchronize the color LEDs to audio input. Integrated high current driver can drive camera flash LED or motor/vibra. Internal ADC can be used for ambient light or temperature sensing. The flexible I<sup>2</sup>C interface allows easy control of LP39542. Small micro SMD package together with minimum number of external components is a best fit for handheld devices.

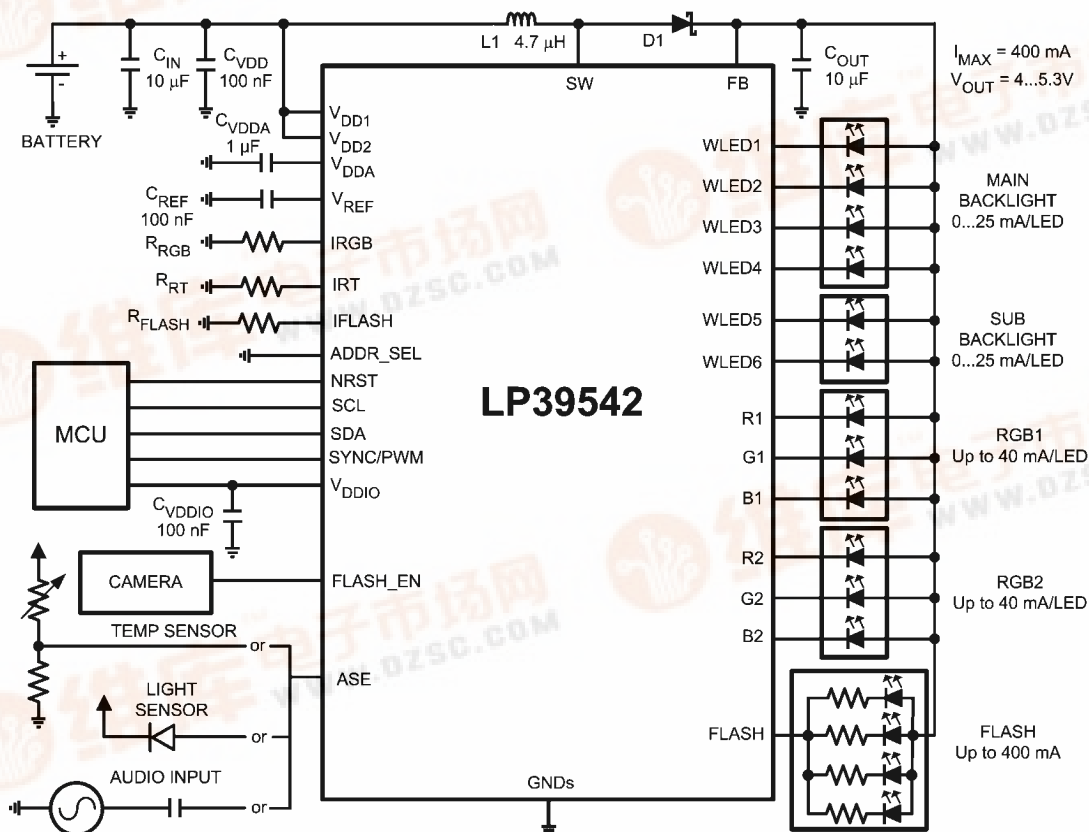

## Features

- Audio synchronization for color/RGB LEDs
- Command based PWM controlled RGB LED drivers
- Programmable ON/OFF blinking sequences for RGB LED
- High current driver for flash LED with built-in timing and safety feature.
- 4+2 or 6 low voltage constant current white LED drivers with programmable 8-bit adjustment (0...25 mA/LED)
- High efficiency Boost DC-DC converter
- I<sup>2</sup>C compatible interface
- Possibility for external PWM dimming control
- Possibility for clock synchronization for RGB timing
- Ambient light and temperature sensing possibility
- Small package – microSMD-36, 3.0 x 3.0 x 0.6 mm

## Applications

- Cellular Phones
- PDAs, MP3 players

## Typical Applications

30008560

## Absolute Maximum Ratings (Notes 1, 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

V (SW, FB, R1-2, G1-2, B1-2, FLASH, WLED1-6)(Notes 3, 4)	-0.3V to +7.2V
$V_{DD1}$ , $V_{DD2}$ , $V_{DDIO}$ , $V_{DDA}$	-0.3V to +6.0V
Voltage on ASE, IRT, IFLASH, IRGB, VREF	-0.3V to $V_{DD1}+0.3V$ with 6.0V max
Voltage on Logic Pins	-0.3V to $V_{DDIO}+0.3V$ with 6.0V max
V(all other pins): Voltage to GND	-0.3V to 6.0V
I ( $V_{REF}$ )	10 $\mu A$
I(R1, G1, B1, R2, G2, B2)	100 mA
I(FLASH)(Note 5)	400 mA
Continuous Power Dissipation (Note 6)	Internally Limited
Junction Temperature ( $T_{J-MAX}$ )	150°C
Storage Temperature Range	-65°C to +150°C
Maximum Lead Temperature (Soldering) (Note 7)	260°C
ESD Rating (Note 8)	
Human Body Model:	2 kV

## Operating Ratings (Notes 1, 2)

V (SW, FB, WLED1-6, R1-2, G1-2, B1-2, FLASH)	0 to 6.0V
$V_{DD1,2}$ with external LDO	2.7 to 5.5V
$V_{DD1,2}$ with internal LDO	3.0 to 5.5V
$V_{DDA}$	2.7 to 2.9V
$V_{DDIO}$	1.65V to $V_{DD1}$
Voltage on ASE	0.1V to $V_{DDA}-0.1V$
Recommended Load Current	0 mA to 400 mA
Junction Temperature ( $T_J$ ) Range	-30°C to +125°C
Ambient Temperature ( $T_A$ ) Range (Note 9)	-30°C to +85°C

## Thermal Properties

Junction-to-Ambient Thermal Resistance( $\theta_{JA}$ ), TLA36AAA or RLA36AAA Package (Note 10)	60°C/W
---	--------

## Electrical Characteristics (Notes 2, 11)

Limits in standard typeface are for  $T_J = 25^\circ\text{C}$ . Limits in **boldface** type apply over the operating ambient temperature range  $(-30^\circ\text{C} < T_A < +85^\circ\text{C})$ . Unless otherwise noted, specifications apply to the LP39542 Block Diagram with:  $V_{DD1} = V_{DD2} = 3.6\text{V}$ ,  $V_{DDIO} = 2.8\text{V}$ ,  $C_{VDD} = C_{VDDIO} = 100\text{ nF}$ ,  $C_{OUT} = C_{IN} = 10\text{ }\mu\text{F}$ ,  $C_{VDDA} = 1\text{ }\mu\text{F}$ ,  $C_{REF} = 100\text{ nF}$ ,  $L_1 = 4.7\text{ }\mu\text{H}$ ,  $R_{FLASH} = 910\Omega$ ,  $R_{RGB} = 5.6\text{ k}\Omega$  and  $R_{RT} = 82\text{ k}\Omega$  (Note 12).

$I_{EXT\_LDO}$	External LDO output current ( $V_{DD1}$ , $V_{DD2}$ , $V_{DDA}$ )	7V tolerant application only $I_{BOOST} = 300\text{ mA}$			<b>6.5</b>	mA
$V_{DDA}$	Output voltage of internal LDO for analog parts	(Note 13)	<b>2.72</b> <b>-3</b>	2.80	<b>2.88</b> <b>+3</b>	V %

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the component may occur. Operating Ratings are conditions under which operation of the device is guaranteed. Operating Ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.

**Note 2:** All voltages are with respect to the potential at the GND pins.

**Note 3:** Battery/Charger voltage should be above 6V no more than 10% of the operational lifetime.

**Note 4:** Voltage tolerance of LP39542 above 6.0V relies on fact that  $V_{DD1}$  and  $V_{DD2}$  (2.8V) are available (ON) at all conditions. If  $V_{DD1}$  and  $V_{DD2}$  are not available (ON) at all conditions, National Semiconductor does not guarantee any parameters or reliability for this device.

**Note 5:** The total load current of the boost converter in worst-case conditions is limited to 300 mA (min. input and max. output voltage).

**Note 6:** Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at  $T_J=160^\circ\text{C}$  (typ.) and disengages at  $T_J=140^\circ\text{C}$  (typ.).

**Note 7:** For detailed soldering specifications and information, please refer to National Semiconductor Application Note AN1112: Micro SMD Wafer Level Chip Scale Package or Application note AN1412: Micro SMDxt Wafer Lever Chip Scale Package

**Note 8:** The Human body model is a 100 pF capacitor discharged through a 1.5 k $\Omega$  resistor into each pin.

**Note 9:** In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature ( $T_{A-MAX}$ ) is dependent on the maximum operating junction temperature ( $T_{J-MAX-OP} = 125^\circ\text{C}$ ), the maximum power dissipation of the device in the application ( $P_{D-MAX}$ ), and the junction-to ambient thermal resistance of the part/package in the application ( $\theta_{JA}$ ), as given by the following equation:  $T_{A-MAX} = T_{J-MAX-OP} - (\theta_{JA} \times P_{D-MAX})$ .

**Note 10:** Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, special care must be paid to thermal dissipation issues in board design.

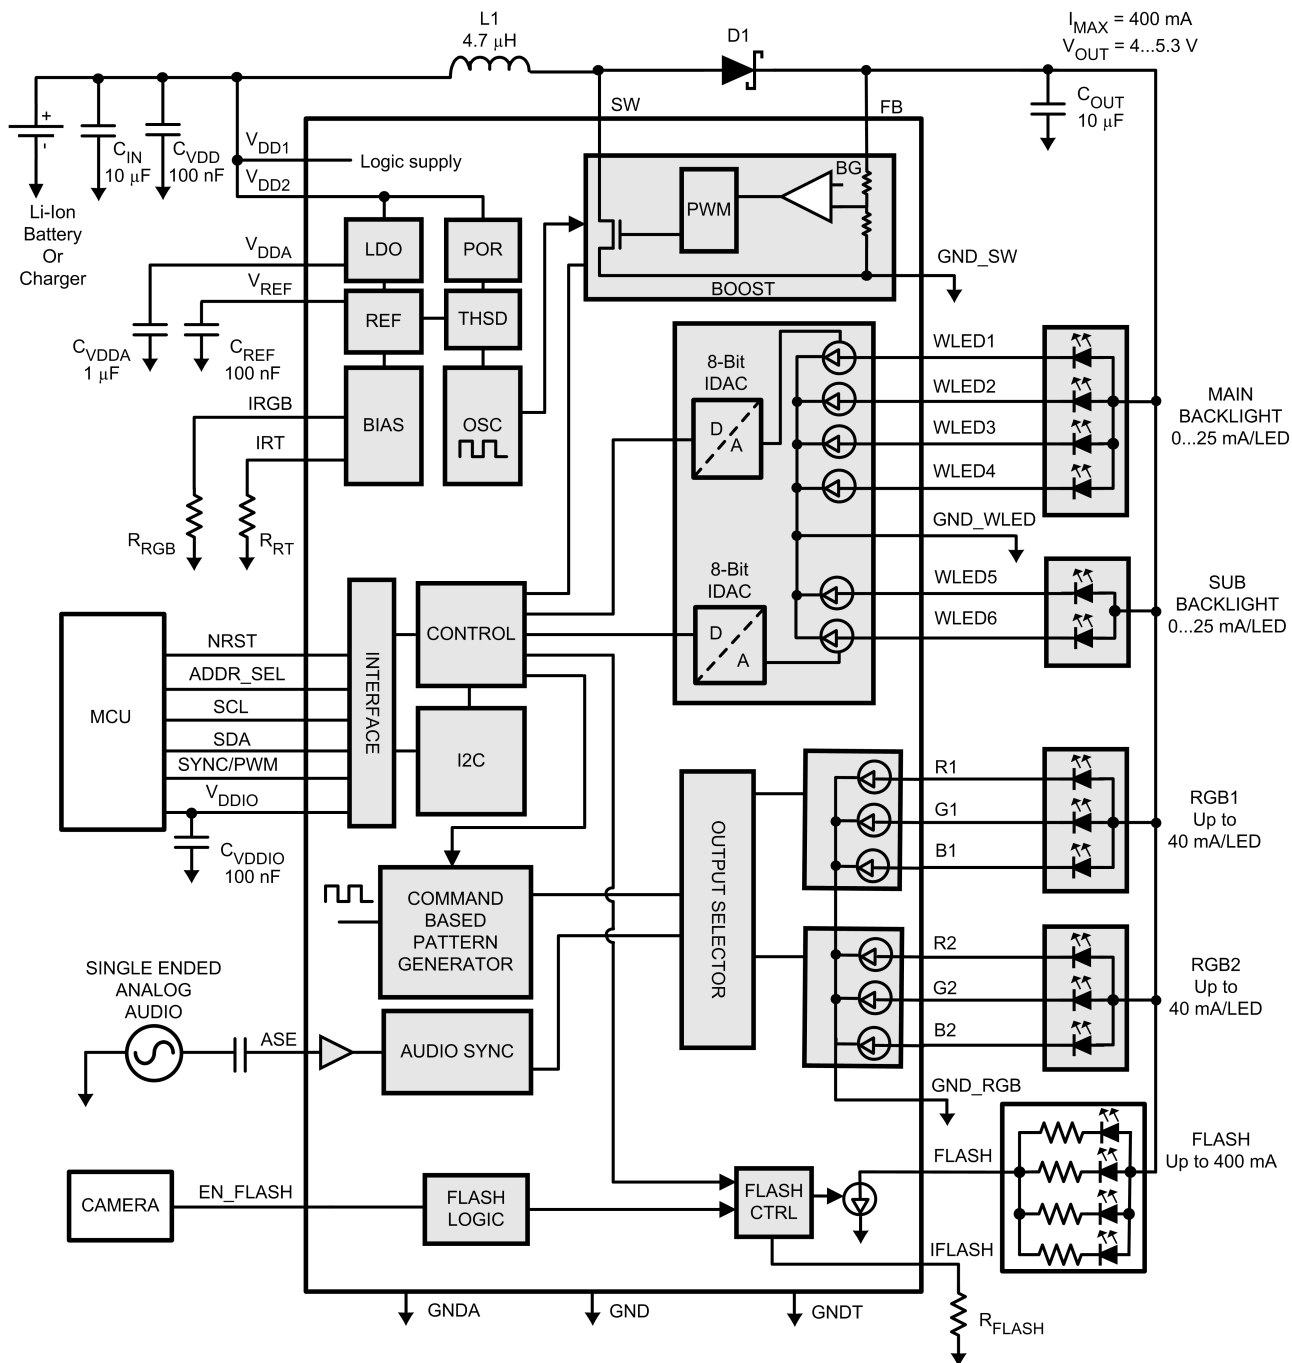

**Note 11:** Min and Max limits are guaranteed by design, test, or statistical analysis. Typical numbers are not guaranteed, but do represent the most likely norm.

**Note 12:** Low-ESR Surface-Mount Ceramic Capacitors (MLCCs) used in setting electrical characteristics.

**Note 13:**  $V_{DDA}$  output is not recommended for external use.

## Modes of Operation

[查询"LP39542"供应商](#)

- RESET:** In the RESET mode all the internal registers are reset to the default values and the chip goes to STANDBY mode after reset. NSTBY control bit is low after reset by default. Reset is active always if NRST input pin is low or internal Power On Reset is active. LP39542 can be also reset by writing any data to Reset Register in address 60H. Power On Reset (POR) will activate during the chip startup or when the supply voltage  $V_{DD2}$  falls below 1.5V. Once  $V_{DD2}$  rises above 1.5V, POR will inactivate and the chip will continue to the STANDBY mode.
- STANDBY:** The STANDBY mode is entered if the register bit NSTBY is LOW. This is the low power consumption mode, when all circuit functions are disabled. Registers can be written in this mode and the control bits are effective immediately after power up.
- STARTUP:** When NSTBY bit is written high, the INTERNAL STARTUP SEQUENCE powers up all the needed internal blocks (Vref, Bias, Oscillator etc..). To ensure the correct oscillator initialization, a 10 ms delay is generated by the internal state-machine. If the chip temperature rises too high, the Thermal Shutdown (TSD) disables the chip operation and STARTUP mode is entered until no thermal shutdown event is present.
- BOOST STARTUP:** Soft start for boost output is generated in the BOOST STARTUP mode. The boost output is raised in PFM mode during the 10 ms delay generated by the state-machine. The Boost startup is entered from Internal Startup Sequence if EN\_BOOST is HIGH or from Normal mode when EN\_BOOST is written HIGH. During the 10 ms Boost Startup time all LED outputs are switched off to ensure smooth start-up.
- NORMAL:** During NORMAL mode the user controls the chip using the Control Registers. The registers can be written in any sequence and any number of bits can be altered in a register in one write

30008507

## Magnetic Boost DC/DC Converter

The LP39542 Boost DC/DC Converter generates a 4.0 – 5.3V voltage for the LEDs from single Li-Ion battery (3V...4.5V). The output voltage is controlled with an 8-bit register in 9 steps. The converter is a magnetic switching PWM mode DC/DC converter with a current limit. The converter has three options for switching frequency, 1 MHz, 1.67 MHz and 2 MHz (default), when timing resistor RT is 82 kΩ. Timing resistor defines the internal oscillator frequency and thus directly affects boost frequency and all circuit's internally generated timing (RGB, Flash, WLED fading).

The LP39542 Boost Converter uses pulse-skipping elimination to stabilize the noise spectrum. Even with light load or no load a minimum length current pulse is fed to the inductor. An active load is used to remove the excess charge from the output capacitor at very light loads. At very light load and when input and output voltages are very close to each other, the pulse skipping is not completely eliminated. Output voltage should be at least 0.5V higher than input voltage to avoid pulse skipping. Reducing the switching frequency will also reduce the required voltage difference.

Active load can be disabled with the en\_autoload bit. Disabling will increase the efficiency at light loads, but the downside is that pulse skipping will occur. The Boost Converter should be stopped when there is no load to minimise the current consumption.

The topology of the magnetic boost converter is called CPM control, current programmed mode, where the inductor current is measured and controlled with the feedback. The user can program the output voltage of the boost converter. The output voltage control changes the resistor divider in the feedback loop.

The following figure shows the boost topology with the protection circuitry. Four different protection schemes are implemented:

1. Over voltage protection, limits the maximum output voltage
  - Keeps the output below breakdown voltage.
  - Prevents boost operation if battery voltage is much higher than desired output.
2. Over current protection, limits the maximum inductor current
  - Voltage over switching NMOS is monitored; too high voltages turn the switch off.
3. Feedback break protection. Prevents uncontrolled operation if FB pin gets disconnected.
4. Duty cycle limiting, done with digital control.

Boost Converter Topology

## BOOST STANDBY MODE

User can stop the Boost Converter operation by writing the Enables register bit EN\_BOOST low. When EN\_BOOST is written high, the converter starts for 10 ms in PFM mode and then goes to PWM mode.

## BOOST OUTPUT VOLTAGE CONTROL

User can control the boost output voltage by boost output 8-bit register.

Boost Output [7:0] Register 0DH		Boost Output Voltage (typical)
Bin	Hex	
0000 0000	00	4.00
0000 0001	01	4.25
0000 0011	03	4.40
0000 0111	07	4.55

## Functionality of Color LED Outputs (R1, G1, B1; R2, G2, B2)

查询"LP39542"供应商

LP39542 has 2 sets of RGB/color LED outputs. Both sets have 3 outputs and the sets can be controlled in 4 different ways:

1. Command based pattern generator control (internal PWM)
2. Audio synchronization control
3. Programmable ON/OFF blinking sequences for RGB1
4. External PWM control

By using **command based pattern generator** user can program any kind of color effect patterns. LED intensity, blinking cycles and slopes are independently controlled with 8 16-bit commands. Also real time commands are possible as well as loops and step by step control. If analog audio is available on system, the user can use **audio synchronization** for synchronizing LED blinking to the music. The different modes together with the various sub modes generate very colorful and interesting lighting effects. **Direct ON/OFF** control is mainly for switching on and off LEDs. **External PWM control** is for applications where external PWM signal is available and required to control the color LEDs. PWM signal can be connected to any color LED separately as shown later.

### COLOR LED CONTROL MODE SELECTION

The RGB\_SEL[1:0] bits in the Enables register (08H) control the output modes for RGB1 (R1, G1, B1) and RGB2 (R2, G2, B2) outputs as seen in the following table.

RGB_SEL [1:0]	Audio sync	Pattern generator	Blinking control
00	-	RGB1 & RGB2	-
01	-	RGB2	RGB1
10	RGB2	RGB1	-
11	RGB1 & RGB2	-	-

**RGB Control register (00H)** has control bits for direct on/off control of all color LEDs. Note that the LEDs have to be turned on in order to control them with audio synchronization or pattern generator.

The external PWM signal can control any LED depending on the control register setup. External PWM signal is connected to PWM/SYNC pin. The controls are in the Ext. PWM Control register (address 07H) except the FLASH control in HC\_Flash (10H) register as follows:

Ext. PWM Control (07H)		
wled1-4_pwm	bit 7	PWM controls WLED 1-4
wled5-6_pwm	bit 6	PWM controls WLED 5-6
r1_pwm	bit 5	PWM controls R1 output
g1_pwm	bit 4	PWM controls G1 output
b1_pwm	bit 3	PWM controls B1 output
r2_pwm	bit 2	PWM controls R2 output
g2_pwm	bit 1	PWM controls G2 output
b2_pwm	bit 0	PWM controls B2 output
HC_Flash (10H)		
hc_pwm	bit 5	PWM controls FLASH

**Note:** If DISPL=1, wled1-4pwm controls WLED1-6

**Note:** Maximum external PWM frequency is 1kHz. If during the external PWM control the internal PWM is on, the result will be product of both functions.

### CURRENT CONTROL OF COLOR LED OUTPUTS (R1, R2, G1, G2, B1, B2)

Both RGB output sets can be separately controlled as constant current sinks or as switches. This is done using cc\_rgb1/2 bits in the RGB control register. In constant current mode one or both RGB output sets are controlled with constant current sinks (no external ballast resistors required). The maximum output current for both drivers is set by one external resistor  $R_{RGB}$ . User can decrease the maximum current for an individual LED driver by programming as shown later.

The maximum current for all RGB drivers is set with  $R_{RGB}$ . The equation for calculating the maximum current is

$$I_{MAX} = 100 \times 1.23V / (R_{RGB} + 50\Omega)$$

where

$I_{MAX}$  - maximum RGB current in any RGB output in constant current mode

1.23V - reference voltage

100 - internal current mirror multiplier

$R_{RGB}$  - resistor value in Ohms

50Ω - internal resistor in the  $I_{RGB}$  input

For example if 22mA is required for maximum RGB current  $R_{RGB}$  equals to

$$R_{RGB} = 100 \times 1.23V / I_{MAX} - 50\Omega = 123V / 0.022A - 50\Omega = 5.54k\Omega$$

Each individual RGB output has a separate maximum current programming. The control bits are in registers **RGB1 max current** and **RGB2 max current** (12H and 13H) and programming is shown in table below. The default value after reset is 00b.

IR1[1:0], IG1[1:0], IB1[1:0], IR2[1:0], IG2[1:0], IB2[1:0]	Maximum current/output
00	$0.25 \times I_{MAX}$
01	$0.50 \times I_{MAX}$
10	$0.75 \times I_{MAX}$
11	$1.00 \times I_{MAX}$

### SWITCH MODE

The switch mode is used if there is a need to connect parallel LEDs to output or if the RGB output current needs to be increased.

Please note that the switch mode **requires an external ballast resistors** at each output to limit the LED current.

The switch/current mode and on/off controls for RGB are in the RGB\_ctrl register (00H).

## Command Based Pattern Generator for Color LEDs

The LP39542 has an unique stand-alone command based pattern generator with 8 user controllable 16-bit commands.

Since registers are 8-bit long one command requires 2 write cycles. Each command has intensity level for each LED, command execution time (CET) and transition time (TT) as seen in the following figures.

30008519

### COLOR INTENSITY CONTROL

Each color has 3-bit intensity level. Level control is logarithmic, 2 curves are selectable. The LOG bit in register 11H defines the curve used as seen in the following table.

R[2:0], G[2:0], B[2:0]	CURRENT [% × I <sub>MAX(COLOR)</sub> ]	
	LOG=0	LOG=1
000	0	0
001	7	1
010	14	2
011	21	4
100	32	10
101	46	21
110	71	46
111	100	100

30008520

## COMMAND EXECUTION TIME (CET) AND TRANSITION TIME (TT)

The command execution CET time is the duration of one single command. Command execution times CET are defined as follows, when  $R_T=82k\Omega$ :

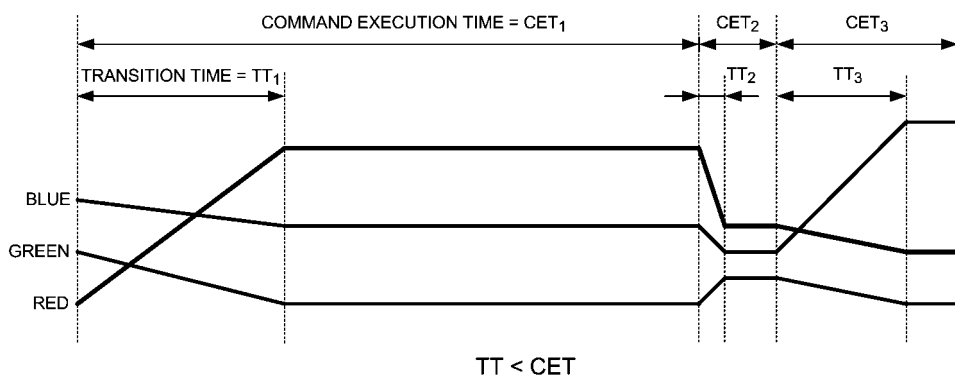

CET [3:0]	CET duration, ms
0000	197
0001	393
0010	590
0011	786
0100	983
0101	1180
0110	1376
0111	1573
1000	1769
1001	1966
1010	2163
1011	2359
1100	2556
1101	2753

CET [3:0]	CET duration, ms
1110	2949
1111	3146

Transition time TT is duration of transition from the previous RGB value to programmed new value. Transition times TT are defined as follows:

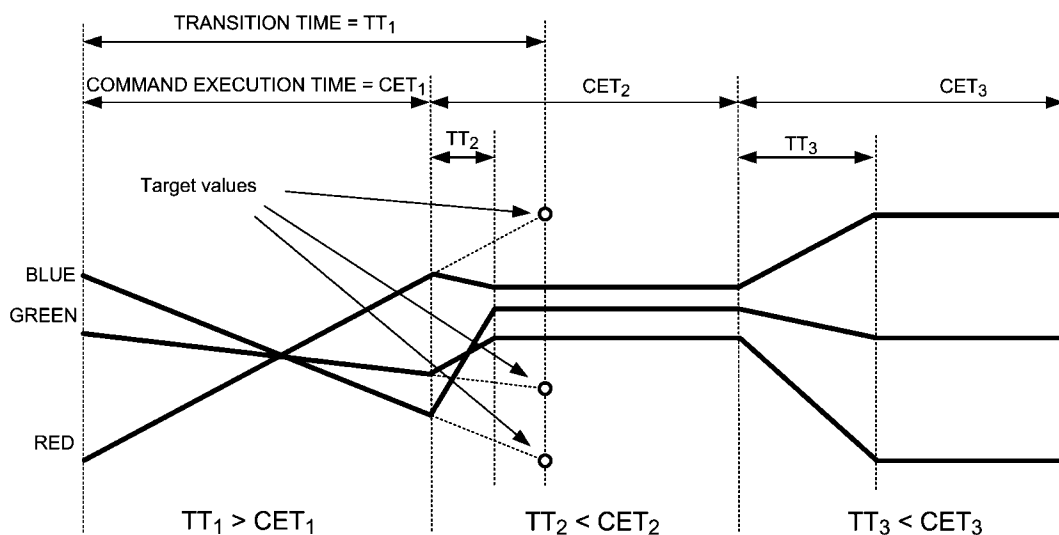

TT [2:0]	Transition time, ms
000	0
001	55
010	110
011	221
100	442
101	885
110	1770
111	3539

The figure below shows an example of RGB CET and TT times.

30008521

The command execution time also may be less than the transition time – the figure below illuminates this case.

30008522

## LOOP CONTROL

If the Pattern generator commands can be looped using the LOOP bit (D1) in Pattern gen ctrl register (11H). If LOOP=1 the program will be looped from the command 8 register or if there

is 0000 0000 and 0000 0000 in one command register. The loop will start from command 1 and continue until stopped by writing rgb\_start=0 or loop=0. The example of loop is shown in following figure:

## SINGLE PROGRAM

If control bit LOOP=0 the program will start from Command 1 and run to either last command or to empty "0000 0000 / 0000 0000" command.

The LEDs maintain the brightness of the last command when the single program stops. Changes in command register will not be effective in this phase. The RGB\_START bit has to be toggled off and on to make changes effective.

## START BIT

Pattern\_gen\_ctrl register's RGB\_START bit will enable command execution starting from Command 1.

Pattern gen ctrl register (11H)		
rgb_start	Bit 2	0 – Pattern generator disabled 1 – execution pattern starting from command 1
loop	Bit 1	0 – pattern generator loop disabled (single pattern) 1 – pattern generator loop enabled (execute until stopped)
log	Bit 0	0 – color intensity mode 0 1 – color intensity mode 1

## Audio Synchronization

The color LEDs connected to RGB outputs can be synchronized to incoming audio with Audio Synchronization feature. Audio Sync has 2 modes. **Amplitude mode** synchronizes color LEDs based on input signal's peak amplitude. In the amplitude mode the user can select between 3 different amplitude mapping modes and 4 different speed configurations. The **frequency mode** synchronizes the color LEDs based on bass, middle and treble amplitudes (= low pass, band pass and high pass filters). User can select between 2 different frequency responses and 4 different speed configurations for best audio-visual user experience. Programmable gain and AGC function are also available for adjustment of input signal amplitude to light response. The Audio Sync functionality is described more closely below.

### USING A DIGITAL PWM AUDIO SIGNAL AS AN AUDIO SYNCHRONIZATION SOURCE

If the input signal is a PWM signal, use a first or second order low pass filter to convert the digital PWM audio signal into an analog waveform. There are two parameters that need to be known to get the filter to work successfully: frequency of the PWM signal and the voltage level of the PWM signal. Suggested cut-off frequency (-3 dB) should be around 2 kHz to 4 kHz and the stop-band attenuation at sampling frequency should be around -48 dB or better. Use a resistor divider to reduce the digital signal amplitude to meet the specification of the analog audio input. Because a low-order low-pass filter attenuates the high-frequency components from audio signal, **MODE\_CTRL=01b** selection is recommended when frequency synchronization mode is enabled. Application example 5 shows an example of a second order RC-filter for 29 kHz

PWM signal with 3.3V amplitude. Active filters, such as a Sallen-Key filter, may also be applied. An active filter gives better stop-band attenuation and cut-off frequency can be higher than for a RC-filter.

To make sure that the filter rolls off sufficiently quickly, connect your filter circuit to the audio input(s), turn on the audio synchronization feature, set manual gain to maximum, apply the PWM signal to the filter input and keep an eye on LEDs. If they are blinking without an audio signal (modulation), a sharper roll-off after the cut-off frequency, more stop-band attenuation, or smaller amplitude of the PWM signal is required.

### AUDIO SYNCHRONIZATION SIGNAL PATH

LP39542 audio synchronization is mainly done digitally and it consists of the following signal path blocks:

- Input Buffers
- AD Converter
- DC Remover
- Automatic Gain Control (AGC)
- Programmable Gain
- 3 Band Digital Filter
- Peak Detector
- Look-up Tables (LUT)
- Mode Selector
- Integrators
- PWM Generator
- Output Drivers

The digitized input signal has DC component that is removed by digital **DC REMOVER** (-3 dB @ 400 Hz). Since the light response of input audio signal is very much amplitude dependent the AGC adjusts the input signal to suitable range automatically. User can disable **AGC** and the gain can be set manually with **PROGRAMMABLE GAIN**. LP39542 has 2 audio synchronization modes: amplitude and frequency. For amplitude based synchronization the **PEAK DETECTION** method is used. For frequency based synchronization **3 BAND FILTER** separates high pass, low pass and band bass signals. For both modes the predefined LUT is used to optimize the audio visual effect. **MODE SELECTOR** selects the synchronization mode. Different response times to music beat can be selected using **INTEGRATOR** speed variables. Finally **PWM GENERATOR** sets the driver FET duty cycles.

### INPUT SIGNAL TYPE AND BUFFERING

LP39542 supports single ended audio input as shown in the figure below. The electric parameters of the buffer are de-

scribed in the Audio Synch table. The buffer is rail-to-rail input operational amplifier connected as a voltage follower. DC level of the input signal is set by a simple resistor divider

## AUDIO SYNCHRONIZATION ELECTRICAL PARAMETERS

Symbol	Parameter	Conditions	Min	Typical	Max	Units
$Z_{IN}$	Input Impedance of ASE		250	500		k $\Omega$
$A_{IN}$	Audio Input Level Range (peak-to-peak)	Gain = 21 dB Gain = 0 dB	0.1		$V_{DDA}-0.1$	V
$f_{3dB}$	Crossover Frequencies (-3 dB) Narrow Frequency Response  Wide Frequency Response	Low Pass Band Pass High Pass Low Pass Band Pass High Pass		0.5 1.0 and 1.5 2.0 1.0 2.0 and 3.0 4.0		kHz

## CONTROL OF ADC AND AUDIO SYNCHRONIZATION

The following table describes the controls required for audio synchronization.

Audio_sync_CTRL1 (2AH)		
<b>GAIN_SEL[2:0]</b>	Bits 7-5	Input signal gain control. Range 0...21 dB, step 3 dB: [000] = 0 dB (default)      [011] = 9 dB      [110] = 18 dB [001] = 3 dB      [100] = 12 dB      [111] = 21 dB [010] = 6 dB      [101] = 15 dB
<b>SYNC_MODE</b>	Bit 4	Synchronization mode selector. SYNCMODE = 0 → Amplitude Mode (default) SYNCMODE = 1 → Frequency Mode
<b>EN_AGC</b>	Bit 3	Automatic Gain Control enable 1 = enabled 0 = disabled (Gain Select enabled) (default)
<b>EN_SYNC</b>	Bit 2	Audio synchronization enable 1 = Enabled Note : If AGC is enabled, AGC gain starts from current GAIN_SEL gain value. 0 = Disabled (default)
<b>INPUT_SEL[1:0]</b>	Bits 1-0	[00] = Single ended input signal, ASE. [01] = Temperature measurement [10] = Ambient light measurement [11] = No input (default)
Audio_sync_CTRL2 (2BH)		
<b>EN_AVG</b>	Bit 4	0 – averaging disabled (not applicable in audio sync mode) 1 – averaging enabled (not applicable in audio sync mode)
<b>MODE_CTRL[1:0]</b>	Bits 3-2	See below: Mode control
<b>SPEED_CTRL[1:0]</b>	Bits 1-0	Sets the LEDs light response time to audio input. [00] = FASTEST (default) [01] = FAST [10] = MEDIUM [11] = SLOW (For SLOW setting in amplitude mode $f_{MAX}$ = 3.8 Hz, Frequency mode $f_{MAX}$ = 7.6 Hz)

### MODE CONTROL IN FREQUENCY MODE

Mode control has two settings based on audio synchronization mode select, the frequency mode and the amplitude mode. During the **frequency mode** user can select two filter options by MODE\_CTRL as shown below. User can select the filters

based on the music type and light effect requirements. In the first mode the frequency range extends to 8 kHz in the second to 4 kHz.

The lowpass filter is used for the red, the bandpass filter for the blue and the hipass filter for the green LED.

**Higher frequency mode**  
MODE\_CTRL = 00 and SYNC\_MODE = 1

30008527

**Lower frequency mode**  
MODE\_CTRL = 01 and SYNC\_MODE = 1

30008528

### MODE CONTROL IN AMPLITUDE MODE

During the **amplitude synchronization mode** user can select between three different amplitude mappings by using

MODE\_CTRL select. These three mapping options give different light response. The modes are presented in the following graphs.

**Non-overlapping mode**  
MODE\_CTRL[1:0] = [01]

30008529

**Partly overlapping mode**  
MODE\_CTRL[1:0] = [00]

30008530

Overlapping mode  
MODE\_CTRL[1:0] = [10]

30008531

Peak Input Signal Level  
Range vs Gain Setting

30008532

## RGB Output Synchronization to External Clock

The RGB pattern generator and high current flash driver timing can be synchronized to external clock with following configuration.

1. Set PWM\_SYNC bit in Enables register to 1

2. Feed SYNC/PWM pin with 5 MHz clock

By this the internal 5 MHz clock is disabled from pattern generator and flash timing circuitry.

The external clock signal frequency will fully determine the timings related to RGB and Flash.

Note: The boost converter will use internal 5 MHz clock even if the external clock is available.

## RGB LED Blinking Control

LP39542 has a possibility to drive indicator LEDs with RGB1 outputs with programmable blinking time. Blinking function is enabled with RGB\_SEL[1:0] bits set as 01b in 0BH register. R1\_CYCLE\_EN, G1\_CYCLE\_EN and B1\_CYCLE\_EN bits in cycle registers (02H, 04H and 06H) enable/disable blinking function for corresponding output. When EN\_BLINK bit is written high in register 11H, the blinking sequences for all outputs (which has CYCLE\_EN bit enabled) starts simultaneously. EN\_BLINK bit should be written high after selecting wanted blinking sequences and enabling CYCLE\_EN bits, to

synchronize outputs to get desired lighting effect. R1SW, G1SW and B1SW bits can be used to enable and disable outputs when wanted.

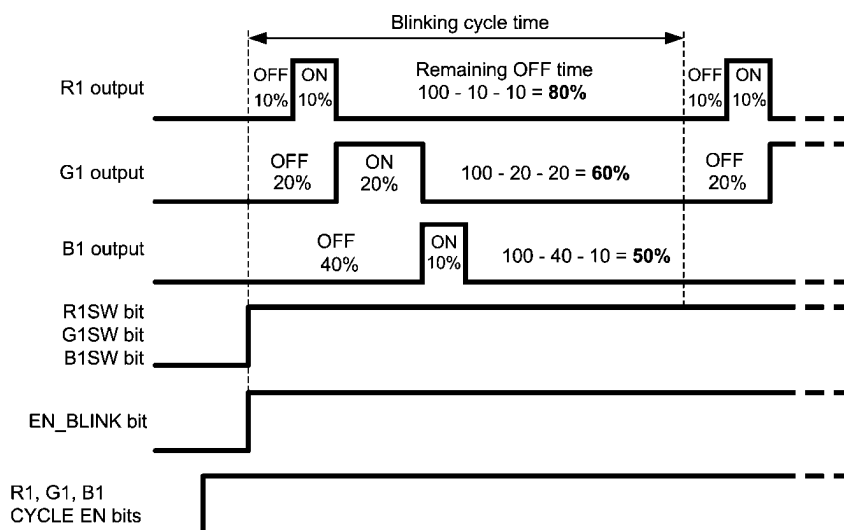

RGB1 blinking sequence is set with R1, G1 and B1 blink registers (01H, 03H and 05H) by setting the appropriate OFF-ON times. Blinking cycle times are set with R1\_CYCLE[2:0], G1\_CYCLE[2:0] and B1\_CYCLE[2:0] bits in R1, G1 and B1 CYCLE registers (02H, 04H and 06H). OFF/ON time is a percentage of the selected cycle time. Values for setting OFF/ON time can be seen in following table.

**R1, G1 and B1 Blink Registers (01H, 03H and 05H):**

Name	Bit	Description	
R1_ON[3:0], R1_OFF[3:0] G1_ON[3:0], G1_OFF[3:0] B1_ON[3:0], B1_OFF[3:0]	7-4, 3-0	RGB1 ON and OFF time	
		Bits	ON/OFF time
		0000	0%
		0001	1%
		0010	2.5%
		0011	5%
		0100	7.5%
		0101	10%
		0110	15%
		0111	20%
		1000	30%
		1001	40%
		1010	50%
		1011	60%
		1100	70%
		1101	80%
		1110	90%
		1111	100%

Blinking ON/OFF cycle is defined so that there will be first OFF-period then ON-period after which follows an off-period for the remaining cycle time that can not be set. If OFF and ON times are together more than 100% the first OFF time will be as set and the ON time is cut to meet 100%. For example,

if 50% OFF time is set and ON time is set greater than 50%, only 50% ON time is used, the exceeding ON time is ignored. If OFF and ON times are together less than 100% the remaining cycle time output is OFF.

30008570

Values for setting the blinking cycle for RGB1 can be seen in following table

## Single High Current Driver

LP39542 has internal constant current driver that is capable of driving high current LED, mainly targeted for FLASH LED in camera phone applications.

### MAXIMUM CURRENT SETUP FOR FLASH

The user sets the maximum current of FLASH with  $R_{FLASH}$  resistor based on following equation:

$$I_{MAX} = 300 \times 1.23V / (R_{FLASH} + 50\Omega),$$

where

$I_{max}$  = maximum flash current in Amps (ie. 0.3A)

1.23V = reference voltage

300 = internal current mirror multiplier

$R_{FLASH}$  = Resistor value in Ohms

50Ω = Internal resistor in the  $I_{FLASH}$  input

For example if 400mA is required for the maximum flash current,  $R_{FLASH}$  equals to

$$R_{FLASH} = 300 \times 1.23V / I_{MAX} - 50\Omega = 369V / 0.4A - 50\Omega = 873\Omega \text{ e.g. } 910\Omega \text{ resistor can be used}$$

### CURRENT CONTROL FOR FLASH

To minimize the internal current consumption, the flash function has an enable bit EN\_HCFLASH in the HC\_Flash register.

EN_HCFLASH	MODE
0	FLASH disabled, no extra current consumption through $R_{FLASH}$
1	FLASH enabled, IFLASH set by HC_SW[1:0] (see below)

HC[1:0] bits in the HC\_Flash register control the FLASH current as show in following table.

HC[1:0]	I(FLASH)
00	$0.25 \times I_{MAX(FLASH)}$
01	$0.50 \times I_{MAX(FLASH)}$
10	$0.75 \times I_{MAX(FLASH)}$
11	$1.00 \times I_{MAX(FLASH)}$

The figure below shows the internal structure for the FLASH driver.

30008533

### FLASH TIMING

Flash output is turned on in lower current View finder mode when the EN\_HCFLASH bit is written high. The actual flash at maximum current starts when the FLASH\_EN digital input pin goes high. The Flash length can be selected from 3 predefined values or the FLASH\_EN pin pulse length can determine how long the flash pulse is. After flash pulse the flash is shut down completely. To enable flash again, EN\_HCFLASH bit must be set to 0 and then 1. The pulse length is controlled by the FT\_T[1:0] bits in register 10H as show in the table below.

FL_T[1:0]	Flash duration typ	Current during view finder/focusing	Current during FLASH
00	200ms	Set by HC[1:0]	HC[11] = $I_{MAX(FLASH)}$
01	400ms	Set by HC[1:0]	HC[11] = $I_{MAX(FLASH)}$
10	600ms	Set by HC[1:0]	HC[11] = $I_{MAX(FLASH)}$
11	EN_FLASH on duration	Set by HC[1:0]	HC[11] = $I_{MAX(FLASH)}$

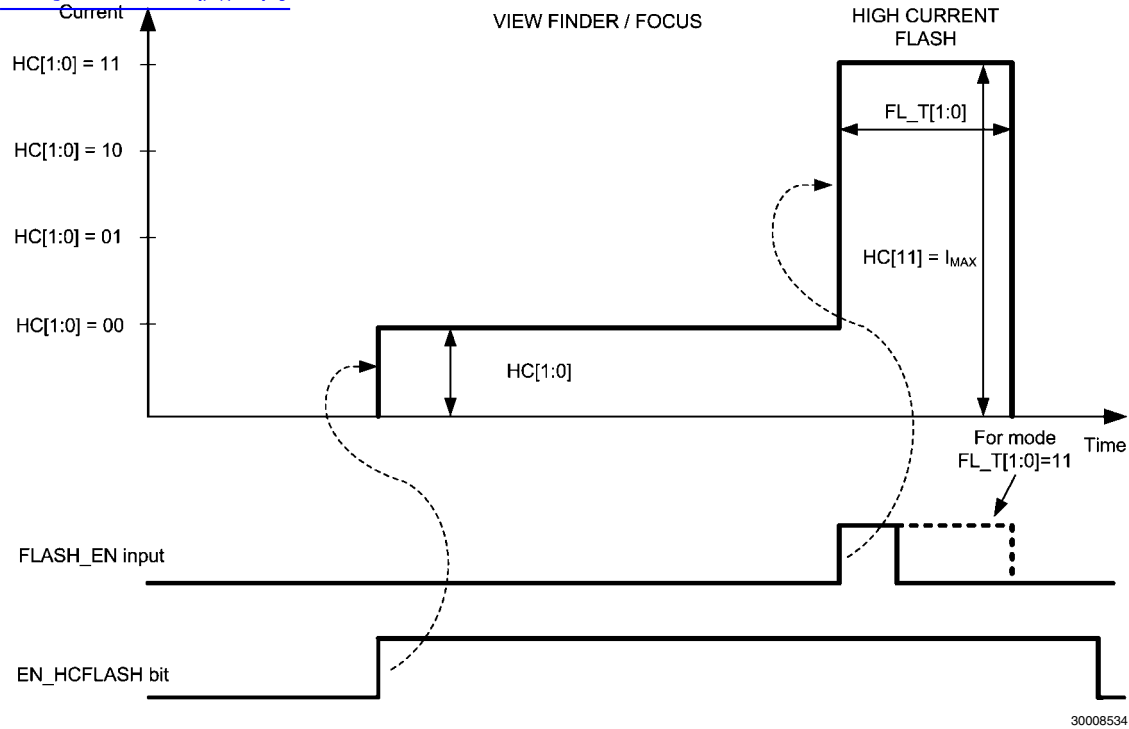

After the flash pulse the EN\_HCFLASH bit has to be written low, the LP39542 does not clear this bit automatically. If 11b is selected in the FL\_T[1:0] register, then it is possible to use safety bit EN\_SAFETY in register 10H. When EN\_SAFETY is 1, then the flash is shut down automatically, if the

FLASH\_EN pulse duration is longer than 1.2 seconds (typ.). This prevents any damage to the application circuitry, if the FLASH\_EN pin is stuck high because of user or program error.

The following figure shows the functionality of the built-in flash

[查询"LP39542"供应商](#)

Flash LED can be controlled also with external PWM signal:

Backlight Drivers

LP39542 has 2 independent backlight drivers. Both drivers are regulated constant current sinks. LED current for both LED banks (WLED1...4 and WLED5...6) are controlled by 8-bit current mode DACs with 0.1 mA step.

WLED1...4 and WLED5...6 can be also controlled with one DAC for better matching allowing the use of larger displays having up to 6 white LEDs in parallel.

Display configuration is controlled with DISPL bit as shown in the following table.

DISPL	Configuration	Matching
0	Main display up to 4 LEDs Sub display up to 2 LEDs	Good btw WLED1...4 Good btw WLED5...6
1	Large display up to 6 LEDs	Good btw WLED 1...6

Main display up to 4 LEDs (WLED1...4)

Sub display driver up to 2 LEDs (WLED5...6)

Main display up to 6 LEDs (WLED1...6) (DISPL=1)

**FADE IN / FADE OUT**

LP39542 has an automatic fade in and out for main and sub backlight. The fade function is enabled to main and sub backlights with EN\_FADE\_W1\_4 and EN\_FADE\_W5\_6 register bits. Register bits SLOPE\_W1\_4 and SLOPE\_W5\_6 set the

slope of the fade curve. The fading times are shown in the graphs, which corresponds the full range current change (0-255). Note that when large display mode is selected (DISPL = 1), then EN\_FADE\_W5\_6 and SLOPE\_W5\_6 bits do not have any effect.

## Ambient Light and Temperature Measurement with LP39542

The Analog-to-Digital Converter (ADC) in the Audio Synchronization block can be also used for ambient light measurement or temperature measurement.

The selection between these modes is controlled with input selector bits INPUT\_SEL[1:0] in register 2AH as seen on the following table. Internal averaging function can be used to filter unwanted noise from the measured signal. Averaging function can be enabled with EN\_AVG bit in register 2BH.

INPUT_SEL[1:0]	Mode
00	Audio synchronization
01	Temperature measurement (voltage input)
10	Ambient light measurement (current input)
11	No input

EN_AVG = 0	Averaging disabled. $f_{\text{sample}} = 122 \text{ Hz}$ , data in register changes every 8.2 ms.
EN_AVG = 1	Averaging enabled. $f_{\text{sample}} = 244 \text{ Hz}$ , averaging of 64 samples, data in register changes every 262 ms (3.2Hz).

### AMBIENT LIGHT MEASUREMENT

The ambient light measurement requires only one external component: Ambient light sensor (photo transistor or diode). The ADC reads the current level at ASE pin and converts the result into a digital word. User can read the ADC output from the ADC output register. The known ambient light condition allows user to set the backlight current to optimal level thus saving power especially in low light and bright sunlight condition.

ASE Input Configuration for Light Measurement

ADC Code vs Input Current in Light Measurement Mode

30008564

### TEMPERATURE MEASUREMENT

The temperature measurement requires two external components: resistor and thermistor (resistor that has known temperature vs resistance curve). The ADC reads the voltage level at ASE pin and converts the result into a digital word. User can read the ADC output from register. The known temperature allows for example to monitor the temperature inside the display module and decrease the current level of the LEDs if temperature raises too high. This function may increase lifetime of LEDs in some applications.

## I<sup>2</sup>C Compatible Interface

### INTERFACE BUS OVERVIEW

The I<sup>2</sup>C compatible synchronous serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bi-directional communications between the devices connected to the bus. The two interface lines are the Serial Data Line (SDA), and the Serial Clock Line (SCL). These lines should be connected to a positive supply, via a pull-up resistor and remain HIGH even when the bus is idle. Every device on the bus is assigned a unique address and acts as either a Master or a Slave depending on whether it generates or receives the serial clock (SCL).

### DATA TRANSACTIONS

One data bit is transferred during each clock pulse. Data is sampled during the high state of the serial clock (SCL). Consequently, throughout the clock's high period, the data should remain stable. Any changes on the SDA line during the high state of the SCL and in the middle of a transaction, aborts the current transaction. New data should be sent during the low SCL state. This protocol permits a single data line to transfer both command/control information and data using the synchronous serial clock.

### I<sup>2</sup>C DATA VALIDITY

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when CLK is LOW.

I<sup>2</sup>C Signals: Data Validity

30008549

### I<sup>2</sup>C START AND STOP CONDITIONS

START and STOP bits classify the beginning and the end of the I<sup>2</sup>C session. START condition is defined as SDA signal transitioning from HIGH to LOW while SCL line is HIGH.

STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The I<sup>2</sup>C master always generates START and STOP bits. The I<sup>2</sup>C bus is considered to be busy after START condition and free after STOP condition. During data transmission, I<sup>2</sup>C master can generate repeated START conditions. First START and repeated START conditions are equivalent, function-wise.

30008550

### TRANSFERRING DATA

Every byte put on the SDA line must be eight bits long, with the most significant bit (MSB) being transferred first. Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the master. The transmitter releases the SDA line (HIGH) during the acknowledge clock pulse. The receiver must pull down the SDA line during the 9<sup>th</sup> clock pulse, signifying an acknowledge. A receiver which has been addressed must generate an acknowledge after each byte has been received.

After the START condition, the I<sup>2</sup>C master sends a chip address. This address is seven bits long followed by an eighth bit which is a data direction bit (R/W). The LP39542 address is 54h or 55h as selected with ADDR\_SEL pin. **I<sup>2</sup>C address for LP39542 is 54H when ADDR\_SEL=0 and 55H when ADDR\_SEL=1.** For the eighth bit, a "0" indicates a WRITE and a "1" indicates a READ. The second byte selects the register to which the data will be written. The third byte contains data to write to the selected register.

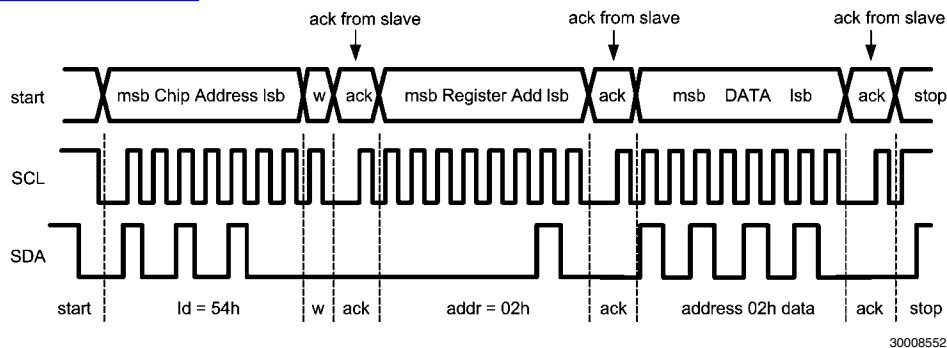

I<sup>2</sup>C Chip Address

30008551

Register changes take an effect at the SCL rising edge during the last ACK from slave.

### [查询"LP39542"供应商](#)

w = write (SDA = "0")

r = read (SDA = "1")

ack = acknowledge (SDA pulled down by either master or slave)

rs = repeated start

id = 7-bit chip address, 54H (ADDR\_SEL=0) or 55H (ADDR\_SEL=1) for LP39542.

### I<sup>2</sup>C Write Cycle

When a READ function is to be accomplished, a WRITE function must precede the READ function, as shown in the Read Cycle waveform.

### I<sup>2</sup>C Read Cycle

6	Data Setup Time	100		ns
7	Rise Time of SDA and SCL	$20+0.1C_b$	300	ns
8	Fall Time of SDA and SCL	$15+0.1C_b$	300	ns
9	Set-up Time for STOP condition	600		ns
10	Bus Free Time between a STOP and a START Condition	1.3		$\mu s$
$C_b$	Capacitive Load for Each Bus Line	10	200	pF

**NOTE:** Data guaranteed by design

Autoincrement mode is available, with this mode it is possible to read or write bytes with autoincreasing addresses. LP39542 has empty spaces in address register map, and it is recommended to use autoincrement mode only for writing in pattern command registers.

## Recommended External Components

### OUTPUT CAPACITOR, $C_{OUT}$

The output capacitor  $C_{OUT}$  directly affects the magnitude of the output ripple voltage. In general, the higher the value of  $C_{OUT}$ , the lower the output ripple magnitude. Multilayer ceramic capacitors with low ESR are the best choice. At the lighter loads, the low ESR ceramics offer a much lower  $V_{out}$  ripple than the higher ESR tantalums of the same value. At the higher loads, the ceramics offer a slightly lower  $V_{out}$  ripple magnitude than the tantalums of the same value. However, the  $dv/dt$  of the  $V_{out}$  ripple with the ceramics is much lower than the tantalums under all load conditions. Capacitor voltage rating must be sufficient, 10V or greater is recommended.

**Some ceramic capacitors, especially those in small packages, exhibit a strong capacitance reduction with the increased applied DC voltage, so called DC bias effect. The capacitance value can fall to below half of the nominal capacitance. Too low output capacitance will increase noise and it can make the boost converter unstable. Recommended maximum DC bias effect at 5V DC voltage is -50%.**

### INPUT CAPACITOR, $C_{IN}$

The input capacitor  $C_{IN}$  directly affects the magnitude of the input ripple voltage and to a lesser degree the  $V_{OUT}$  ripple. A higher value  $C_{IN}$  will give a lower  $V_{IN}$  ripple. Capacitor voltage rating must be sufficient, 10V or greater is recommended.

### OUTPUT DIODE, $D_1$

A schottky diode should be used for the output diode. Peak repetitive current rating of the schottky diode should be larger

than the peak inductor current (ca. 1A). Average current rating of the schottky diode should be higher than maximum output current (400 mA). Schottky diodes with a low forward drop and fast switching speeds are ideal for increasing efficiency in portable applications. Choose a reverse breakdown of the schottky diode larger than the output voltage. Do not use ordinary rectifier diodes, since slow switching speeds and long recovery times cause the efficiency and the load regulation to suffer.

### INDUCTOR, $L_1$

The LP39542's high switching frequency enables the use of the small surface mount inductor. A 4.7  $\mu$ H shielded inductor is suggested for 2 MHz operation, 10  $\mu$ H should be used at 1 MHz. The inductor should have a saturation current rating higher than the peak current it will experience during circuit operation (**ca. 1A**). Less than 300 m $\Omega$  ESR is suggested for high efficiency. Open core inductors cause flux linkage with circuit components and interfere with the normal operation of the circuit. This should be avoided. For high efficiency, choose an inductor with a high frequency core material such as ferrite to reduce the core losses. To minimize radiated noise, use a toroid, pot core or shielded core inductor. The inductor should be connected to the SW pin as close to the IC as possible. Examples of suitable inductors are: TDK VLF4012AT-4R7M1R1 and Panasonic ELLVEG4R7N.

### LIST OF RECOMMENDED EXTERNAL COMPONENTS

Symbol	Symbol explanation	Value	Unit	Type

There may be cases where the audio input signal going into the LP39542 is too weak for audio synchronization. This figure presents a single-supply inverting amplifier connected to the ASE input for audio signal amplification. The amplification is +20 dB, which is well enough for 20 mVp-p audio signal. Because the amplifier (LMV321) is operating in single supply voltage, a voltage divider using R3 and R4 is implemented to bias the amplifier so the input signal is within the input common-mode voltage range of the amplifier. The capacitor C1 is placed between the inverting input and resistor R1 to block the DC signal going into the audio signal source. The values of R1 and C1 affect the cutoff frequency,  $f_c = 1/(2\pi \cdot R_1 \cdot C_1)$ , in this case it is around 160 Hz. As a result, the LMV321 output signal is centered around mid-supply, that is  $V_{DDA}/2$ . The output can swing to both rails, maximizing the signal-to-noise ratio in a low voltage system

### LIFE SUPPORT POLICY

**NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION.** As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
