8-Line Multiplexer

The MC10164 is a high speed, low power eight-channel data selector which routes data present at one-of-eight inputs to the output. The data is routed according to the three bit code present on the address inputs. An enable input is provided for easy bit expansion.

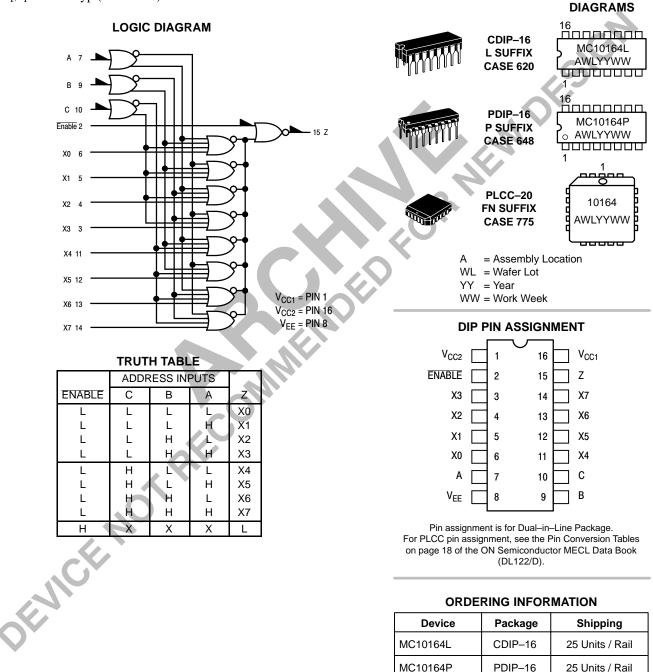

- $P_D = 310 \text{ mW typ/pkg}$ (No Load)
- $t_{pd} = 3.0$ ns typ (Data to Output)
- $t_r, t_f = 2.0 \text{ ns typ} (20\% 80\%)$

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.

APPLICATION INFORMATION

The MC10164 can be used wherever data multiplexing or parallel to serial conversion is desirable. Full parallel gating permits equal delays through any data path. The output of the MC10164 incorporates a buffer gate with eight data inputs and an enable. A high level on the enable forces the output low. The MC10164 can be connected directly to a data bus, due to its open emitter output and output enable. Figure 1 illustrates how a 1–of–64 line multiplexer can be built with eight MC10164's wire ORed at their outputs and one MC10161 to drive the enables on each multiplexer, without speed degradation over a single MC10164 being experienced.
