

Dual Channel 14-/12-Bit, 250-/210-MSPS ADC With DDR LVDS and Parallel CMOS Outputs

FEATURES

- Maximum Sample Rate: 250 MSPS
- 14-Bit Resolution – ADS62P49/ADS62P48
- 12-Bit Resolution – ADS62P29/ADS62P28
- Total Power: 1.25 W at 250 MSPS
- Double Data Rate (DDR) LVDS and Parallel CMOS Output Options
- Programmable Gain up to 6dB for SNR/SFDR Trade-Off
- DC Offset Correction
- 90dB Cross-Talk
- Supports Input Clock Amplitude Down to 400 mV_{PP} Differential

- Internal and External Reference Support
- 64-QFN Package (9 mm × 9 mm)

ADS62PXX HIGH SPEED FAMILY

	250 MSPS	210 MSPS	200 MSPS
14-Bit Family	ADS62P49	ADS62P48	
12-Bit Family	ADS62P29	ADS62P28	
11-Bit Family			ADS62C17

DESCRIPTION

The ADS62Px9/x8 is a family of dual channel 14-bit and 12-bit A/D converters with sampling rates up to 250 MSPS. It combines high dynamic performance and low power consumption in a compact 64 QFN package. This makes it well-suited for multi-carrier, wide band-width communications applications.

The ADS62Px9/x8 has gain options that can be used to improve SFDR performance at lower full-scale input ranges. It includes a dc offset correction loop that can be used to cancel the ADC offset. Both DDR LVDS (Double Data Rate) and parallel CMOS digital output interfaces are available.

It includes internal references while the traditional reference pins and associated decoupling capacitors have been eliminated. Nevertheless, the device can also be driven with an external reference. The device is specified over the industrial temperature range (–40°C to 85°C).

Performance Summary

AT 170MHZ INPUT		ADS62P49	ADS62P48	ADS62P29	ADS62P28
SFDR, dBc	0 dB gain	75	78	75	78
	6 dB gain	82	84	82	84
SINAD, dBFS	0 dB gain	69.8	70.1	68.3	68.7
	6 dB gain	66.5	66.3	65.8	65.8
Analog Power, W		1	0.92	1	0.92

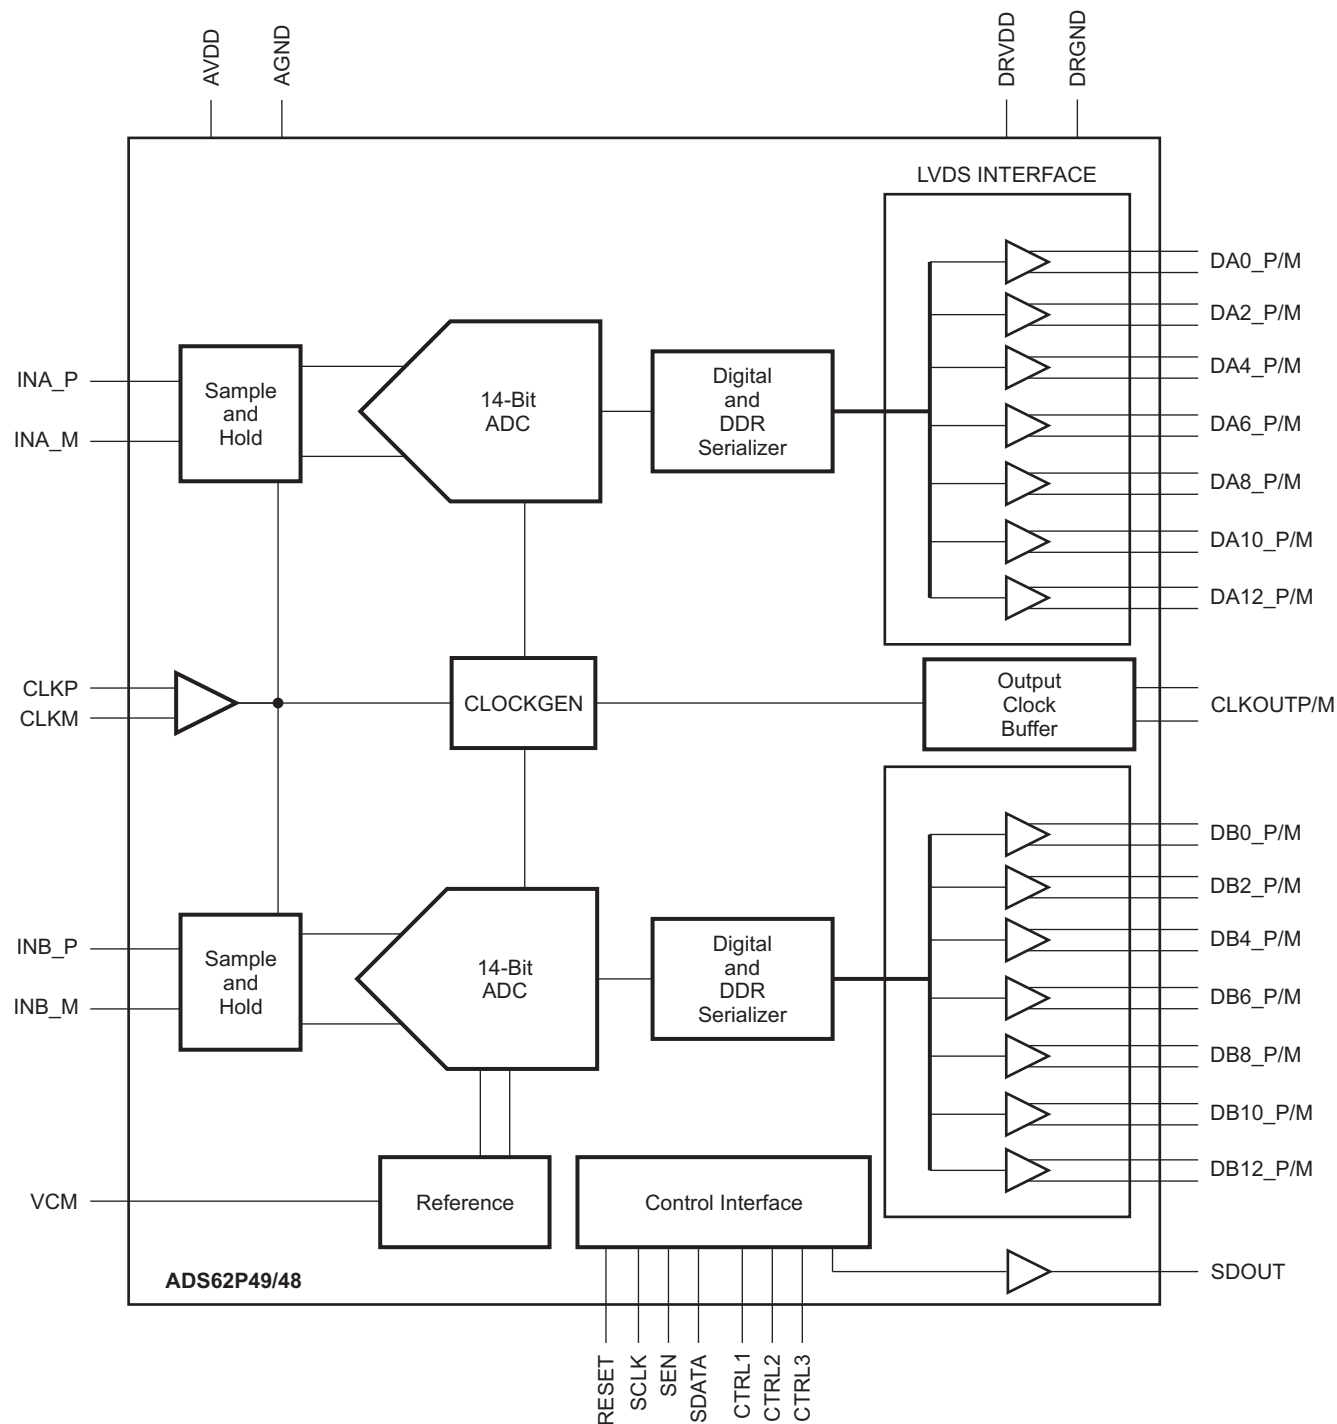

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

PACKAGE/ORDERING INFORMATION⁽¹⁾

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR	SPECIFIED TEMPERATURE RANGE	ECO PLAN ⁽²⁾	LEAD/BALL FINISH	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
ADS62P49	QFN-64	RGC	–40°C to 85°C	GREEN (RoHS and no Sb/Br)	Cu NiPdAu	AZ62P49	ADS62P49IRGCT, ADS62P49IRGCR	Tape and Reel
ADS62P48						AZ62P48	ADS62P48IRGCT, ADS62P48IRGCR	
ADS62P29						AZ62P29	ADS62P29IRGCT, ADS62P29IRGCR	Tape and Reel
ADS62P28						AZ62P28	ADS62P28IRGCT, ADS62P28IRGCR	

- (1) For the most current product and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com. or
- (2) Eco Plan – The planned eco-friendly classification: Green (RoHS and no Sb/Br): TI defines “Green” to mean Pb-Free (RoHS compatible) and free of Bromine (Br) and Antimony (Sb) based flame retardants.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

	VALUE	UNIT
Supply voltage range, AVDD	–0.3 V to 3.9	V
Supply voltage range, DRVDD	–0.3 V to 2.2	V
Voltage between AGND and DRGND	–0.3 to 0.3	V
Voltage between AVDD to DRVDD (when AVDD leads DRVDD)	0 to 3.3	V
Voltage between DRVDD to AVDD (when DRVDD leads AVDD)	–1.5 to 1.8	V
Voltage applied to external pin, VCM (in external reference mode)	–0.3 to 2.0	V
Voltage applied to analog input pins – INP_A, INM_A, INP_B, INM_B	–0.3V to minimum (3.6, AVDD + 0.3V)	V
Voltage applied to input pins - CLKP, CLKM ⁽²⁾ , RESET, SCLK, SDATA, SEN, CTRL1, CTRL2, CTRL3	–0.3V to AVDD + 0.3V	V
T _A Operating free-air temperature range	–40 to 85	°C
T _J Operating junction temperature range	125	°C
T _{stg} Storage temperature range	–65 to 150	°C
ESD, human body model	2	kV

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
- (2) When AVDD is turned off, it is recommended to switch off the input clock (or ensure the voltage on CLKP, CLKM is < |0.3V|. This prevents the ESD protection diodes at the clock input pins from turning on.

THERMAL CHARACTERISTICS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
R _{θJA} ⁽²⁾	Soldered thermal pad, no airflow		22		°C/W
	Soldered thermal pad, 200 LFM		15		°C/W
R _{θJT} ⁽³⁾	Bottom of package (thermal pad)		0.57		°C/W

- (1) With a JEDEC standard high-K board and 5x5 via array. See Exposed Pad in the Application Information.
- (2) R_{θJA} is the thermal resistance from the junction to ambient.
- (3) R_{θJT} is the thermal resistance from the junction to the thermal pad.

RECOMMENDED OPERATING CONDITIONS

		MIN	TYP	MAX	UNIT
SUPPLIES					
AVDD	Analog supply voltage	3.15	3.3	3.6	V
DRVDD	Digital supply voltage	1.7	1.8	1.9	V
ANALOG INPUTS					
Differential input voltage range		2			V _{PP}
Input common-mode voltage		1.5 ±0.1			V
Voltage applied on CM in external reference mode		1.5±0.05			V
Maximum analog input frequency with 2 V _{pp} input amplitude ⁽¹⁾		500			MHz
Maximum analog input frequency with 1 V _{pp} input amplitude ⁽¹⁾		800			MHz
CLOCK INPUT					
Input clock sample rate					
ADS62P49 / ADS62P29	Enable low speed mode ⁽²⁾	1	100		MSPS
	Low speed mode disabled (default mode after reset)	>100	250 ⁽³⁾		
ADS62P48 / ADS62P28	Enable low speed mode	1	100		MSPS
	Low speed mode disabled (default mode after reset)	>100	210		
	With multiplexed mode enabled ⁽⁴⁾	1	65		MSPS
Input clock amplitude differential (V _{CLKP} –V _{CLKM})					
Sine wave, ac-coupled		0.2	3		V _{PP}
LVPECL, ac-coupled		1.6			V _{PP}
LVDS, ac-coupled		0.7			V _{PP}
LVCMOS, single-ended, ac-coupled		3.3			V
Input clock duty cycle		40%	50%	60%	
DIGITAL OUTPUTS					
C _{LOAD}	Maximum external load capacitance from each output pin to DRGND	5			pF
R _{LOAD}	Differential load resistance between the LVDS output pairs (LVDS mode)	100			Ω
T _A	Operating free-air temperature	–40			85
					°C

(1) See the [Theory of Operation](#) section for information.

(2) Use register bit <ENABLE LOW SPEED MODE>, refer to the [Serial Register Map](#) section for information.

(3) With LVDS interface only; maximum recommended sample rate with CMOS interface is 210 MSPS.

(4) See the [Multiplexed Output Mode](#) section for information.

ELECTRICAL CHARACTERISTICS – ADS62P49/48 and ADS62P29/28

Typical values are at 25°C, AVDD = 3.3V, DRVDD = 1.8V, 50% clock duty cycle, –1dBFS differential analog input, internal reference mode (unless otherwise noted).

Min and max values are across the full temperature range T_{MIN} = –40°C to T_{MAX} = 85°C, AVDD = 3.3V, DRVDD = 1.8V

PARAMETER		ADS62P49/ADS62P29 250 MSPS			ADS62P48/ADS62P28 210 MSPS			UNIT
		MIN	TYP	MAX	MIN	TYP	MAX	
ANALOG INPUT								
	Differential input voltage range (0 dB gain)	2			2			V _{pp}
	Differential input resistance (at dc), See Figure 94	> 1			> 1			MΩ
	Differential input capacitance, See Figure 95	3.5			3.5			pF
	Analog input bandwidth (with 25Ω source impedance)	700			700			MHz
	Analog Input common mode current (per channel)	3.6			3.6			μA/MSPS
VCM	Common mode output voltage	1.5			1.5			V
VCM	Output current capability	±4			±4			mA
DC ACCURACY								
	Offset error	−20	±2	20	−20	±2	20	mV
	Temperature coefficient of offset error	0.02			0.02			mV/ °C
	Variation of offset error with supply	0.5			0.5			mV/V
	There are two sources of gain error – internal reference inaccuracy and channel gain error.							
E _{GREF}	Gain error due to internal reference inaccuracy alone	−1	±0.2	1	−1	±0.2	1	% FS
E _{GCHAN}	Gain error of channel alone ⁽¹⁾	−1	±0.2	1	−1	±0.2	1	% FS
	Temperature coefficient of E _{GCHAN}			0.002	0.002			Δ% /°C
Gain matching ⁽²⁾	Difference in gain errors between two channels within the same device			−2	2			% FS
	Difference in gain errors between two channels across two devices			−4	4			
POWER SUPPLY								
IAVDD	Analog supply current	305 350			280 320			mA
IDRVDD	Output buffer supply current, LVDS interface with 100 Ω external termination	133 175			122 165			mA
IDRVDD	Output buffer supply current, CMOS interface, Fin = 2MHz, No external load capacitance ⁽³⁾⁽⁴⁾	–			91			mA
	Analog power	1.01 1.15			0.92 1.05			W
	Digital power, LVDS interface	0.24 0.315			0.22 0.3			W
	Global power down	45 100			45 100			mW

(1) This is specified by design and characterization; it is not tested in production.

(2) For two channels within the same device, only the channel gain error matters, as the reference is common for both channels.

(3) In CMOS mode, the DRVDD current scales with the sampling frequency, the load capacitance on output pins, input frequency and the supply voltage (see [Figure 86](#) and CMOS interface power dissipation in application section).

(4) The maximum DRVDD current with CMOS interface depends on the actual load capacitance on the digital output lines. Note that the maximum recommended load capacitance on each digital output line is 10 pF.

ELECTRICAL CHARACTERISTICS – ADS62P49/48

Typical values are at 25°C, AVDD = 3.3V, DRVDD = 1.8V, 50% clock duty cycle, –1dBFS differential analog input, 0 dB gain, internal reference mode (unless otherwise noted).

Min and max values are across the full temperature range T_{MIN} = –40°C to T_{MAX} = 85°C, AVDD = 3.3V, DRVDD = 1.8V

V _{ODL}	Low-level output differential voltage	With external 100 Ω termination.	–425	–350	–275	mV
V _{OCM}	Output common-mode voltage		1	1.15	1.4	V
Output Capacitance		Capacitance inside the device from each output to ground		2		pF

- (1) SCLK, SDATA, SEN function as digital input pins in serial configuration mode.
(2) SDATA, SCLK have internal 200 kΩ pull-down resistor
(3) SEN has internal 100 kΩ pull-up resistor to AVDD. Since the pull-up is weak, SEN can also be driven by 1.8V or 3.3V CMOS buffers.

T0334-02

- (1) With external 100-Ω termination

Figure 3. LVDS Output Voltage Levels

TIMING REQUIREMENTS – LVDS AND CMOS MODES⁽¹⁾

Typical values are at 25°C, AVDD = 3.3V, DRVDD = 1.8V, sampling frequency = 250 MSPS, sine wave input clock, 1.5 Vpp clock amplitude, C_{LOAD} = 5pF⁽²⁾, R_{LOAD} = 100Ω⁽³⁾, (unless otherwise noted).

Min and max values are across the full temperature range T_{MIN} = –40°C to T_{MAX} = 85°C, AVDD = 3.3V, DRVDD = 1.7V to 1.9V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
t _a	Aperture delay		0.7	1.2	1.7	ns	
	Aperture delay matching	Between two channels within the same device	±50			ps	
t _j	Aperture jitter		145			fs rms	
	Wake-up time	Time to valid data after coming out of STANDBY mode	1			3	μs
		Time to valid data after coming out of global powerdown	20			50	μs
		Time to valid data after stopping and restarting the input clock	10				Clock cycles
ADC latency ⁽⁴⁾			22			Clock cycles	
DDR LVDS MODE ⁽⁵⁾							
t _{su}	Data setup time	Data valid ⁽⁶⁾ to zero-crossing of CLKOUTP	0.55	0.9		ns	
t _h	Data hold time	Zero-crossing of CLKOUTP to data becoming invalid ⁽⁶⁾	0.55	0.95		ns	
t _{PDI}	Clock propagation delay	Input clock falling edge cross-over to output clock rising edge cross-over 100 MSPS ≤ Sampling frequency ≤ 250 MSPS Ts = 1/Sampling frequency	t _{PDI} = 0.69×Ts + t _{delay}				
t _{delay}		4.2	5.7	7.2	ns		
t _{delay} skew		Difference in t _{delay} between two devices operating at same temperature and DRVDD supply voltage	±500			ps	
LVDS bit clock duty cycle		Duty cycle of differential clock, (CLKOUTP-CLKOUTM) 100 MSPS ≤ Sampling frequency ≤ 250 MSPS	52%				
t _{RISE} , t _{FALL}	Data rise time, Data fall time	Rise time measured from –100mV to +100mV Fall time measured from +100mV to –100mV 1MSPS ≤ Sampling frequency ≤ 250 MSPS	0.14			ns	
t _{CLKRISE} , t _{CLKFALL}	Output clock rise time, Output clock fall time	Rise time measured from –100mV to +100mV Fall time measured from +100mV to –100mV 1 MSPS ≤ Sampling frequency ≤ 250 MSPS	0.14			ns	
t _{OE}	Output buffer enable to data delay	Time to valid data after output buffer becomes active	100			ns	
PARALLEL CMOS MODE ⁽⁷⁾ at Fs = 210 MSPS							
t _{START}	Input clock to data delay	Input clock falling edge cross-over to start of data valid ⁽⁸⁾	2.5			ns	
t _{DV}	Data valid time	Time interval of valid data ⁽⁸⁾	1.7	2.7		ns	
t _{PDI}	Clock propagation delay	Input clock falling edge cross-over to output clock rising edge cross-over 100 MSPS ≤ Sampling frequency ≤ 150 MSPS Ts = 1/Sampling frequency	t _{PDI} = 0.28 × Ts + t _{delay}				
t _{delay}		5.5	7.0	8.5	ns		
Output clock duty cycle		Duty cycle of output clock, CLKOUT 100 MSPS ≤ Sampling frequency ≤ 150 MSPS	43%				
t _{RISE} , t _{FALL}	Data rise time, Data fall time	Rise time measured from 20% to 80% of DRVDD Fall time measured from 80% to 20% of DRVDD 1 ≤ Sampling frequency ≤ 210 MSPS	1.2			ns	
t _{CLKRISE} , t _{CLKFALL}	Output clock rise time, Output clock fall time	Rise time measured from 20% to 80% of DRVDD Fall time measured from 80% to 20% of DRVDD 1 ≤ Sampling frequency ≤ 150 MSPS	0.8			ns	

(1) Timing parameters are ensured by design and characterization and not tested in production

(2) C_{LOAD} is the effective external single-ended load capacitance between each output pin and ground

(3) R_{LOAD} is the differential load resistance between the LVDS output pair.

(4) At higher frequencies, t_{PDI} is greater than one clock period and overall latency = ADC latency + 1.

(5) Measurements are done with a transmission line of 100Ω characteristic impedance between the device and the load. Setup and hold time specifications take into account the effect of jitter on the output data and clock.

(6) Data valid refers to LOGIC HIGH of +100.0mV and LOGIC LOW of –100.0mV.

(7) For Fs > 150 MSPS, it is recommended to use external clock for data capture and NOT the device output clock signal (CLKOUT).

(8) Data valid refers to LOGIC HIGH of 1.26V and LOGIC LOW of 0.54V.

TIMING REQUIREMENTS – LVDS AND CMOS MODES (continued)

Typical values are at 25°C, AVDD = 3.3V, DRVDD = 1.8V, sampling frequency = 250 MSPS, sine wave input clock, 1.5 Vpp clock amplitude, C_{LOAD} = 5pF, R_{LOAD} = 100Ω, (unless otherwise noted).

Min and max values are across the full temperature range T_{MIN} = –40°C to T_{MAX} = 85°C, AVDD = 3.3V, DRVDD = 1.7V to 1.9V

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t _{OE}	Output buffer enable (OE) to data delay	Time to valid data after output buffer becomes active		100		ns

Table 1. LVDS Timings at Lower Sampling Frequencies

Sampling Frequency, MSPS	Setup Time, ns			Hold Time, ns		
	MIN	TYP	MAX	MIN	TYP	MAX
210	0.75	1.1		0.75	1.15	
185	0.9	1.25		0.85	1.25

DEVICE CONFIGURATION

ADS62Px9/x8 can be configured independently using either parallel interface control or serial interface programming.

PARALLEL CONFIGURATION ONLY

To put the device in parallel configuration mode, keep RESET tied to **high** (AVDD).

Now, pins SEN, SCLK, CTRL1, CTRL2 and CTRL3 can be used to directly control certain modes of the ADC. The device can be easily configured by connecting the parallel pins to the correct voltage levels (as described in [Table 3](#) to [Table 6](#)). There is no need to apply reset and SDATA pin can be connected to ground..

In this mode, SEN and SCLK function as parallel interface control pins. Frequently used functions can be controlled in this mode – Power down modes, internal/external reference, selection between LVDS/CMOS interface and output data format.

[Table 3](#) has a brief description of the modes controlled by the four parallel pins.

Table 3. Parallel Pin Definition

PIN	TYPE OF PIN	CONTROLS MODES
SCLK	Analog control pins (controlled by analog voltage levels, see Figure 8)	Coarse gain and internal/external reference
SEN		LVDS/CMOS interface and output data format
CTRL1	Digital control pins (controlled by digital logic levels)	Controls standby modes and MUX mode.
CTRL2		
CTRL3		

SERIAL INTERFACE CONFIGURATION ONLY

To exercise this mode, first the serial registers have to be reset to their default values and RESET pin has to be kept **low**.

SEN, SDATA and SCLK function as serial interface pins in this mode and can be used to access the internal registers of the ADC.

The registers can be reset either by applying a pulse on RESET pin or by setting the **<RESET>** bit **high**. The serial interface section describes the register programming and register reset in more detail

DETAILS OF PARALLEL CONFIGURATION ONLY

The functions controlled by each parallel pin are described below. A simple way of configuring the parallel pins is shown in [Figure 7](#).

Table 4. SCLK CONTROL PIN

VOLTAGE APPLIED ON SCLK	DESCRIPTION
0 +200mV/-0mV	Internal reference
(3/8)AVDD +/- 200mV	External reference
(5/8)2AVDD +/- 200mV	External reference
AVDD +0mV/-200mV	Internal reference

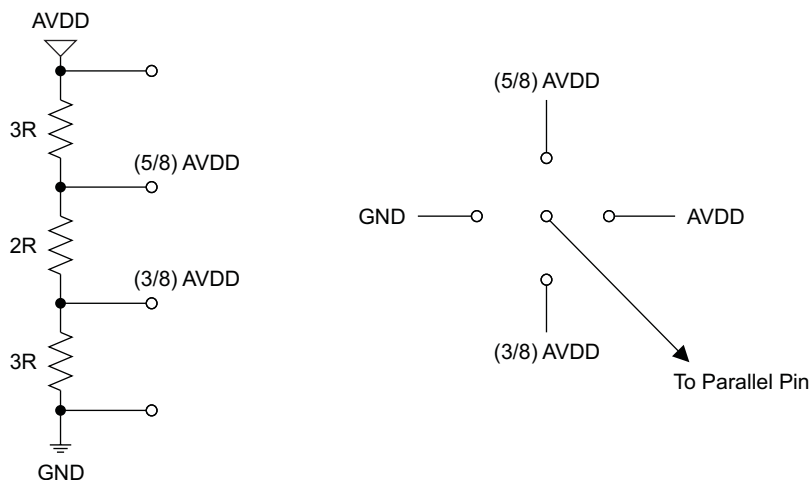

Table 5. SEN CONTROL PIN

VOLTAGE APPLIED ON SEN	DESCRIPTION
0 +200mV/-0mV	Offset binary and DDR LVDS output
(3/8)AVDD +/- 200mV	2's complement format and DDR LVDS output
(5/8)AVDD +/- 200mV	2's complement format and parallel CMOS output
AVDD +0mV/-200mV	Offset binary and parallel CMOS output

Table 6. CTRL1, CTRL2 and CTRL3 PINS⁽¹⁾

CTRL1	CTRL2	CTRL3	DESCRIPTION
LOW	LOW	LOW	Normal operation
LOW	LOW	HIGH	Do not use, reserved for future
LOW	HIGH	LOW	Do not use, reserved for future
LOW	HIGH	HIGH	Do not use, reserved for future
HIGH	LOW	LOW	Global power down
HIGH	LOW	HIGH	Channel B standby
HIGH	HIGH	LOW	Channel A standby
HIGH	HIGH	HIGH	MUX mode of operation, Channel A and B data is multiplexed and output on DA13 to DA0 pins.

(1) See **POWER DOWN** in the APPLICATION INFORMATION section.

S0321-01

Figure 7. Simple Scheme to Configure Parallel Pins

USING BOTH SERIAL INTERFACE AND PARALLEL CONTROLS

For increased flexibility, a combination of serial interface registers and parallel pin controls (CTRL1 to CTRL3) can also be used to configure the device. To allow this, keep RESET low. The parallel interface control pins CTRL1 to CTRL3 are available. After power-up, the device is automatically configured as per the voltage settings on these pins (see Table 6). SEN, SDATA, and SCLK function as serial interface digital pins and are used to access the internal registers of ADC. The registers must first be reset to their default values either by applying a pulse on RESET pin or by setting bit <RST> = 1. After reset, the RESET pin must be kept low. The Serial Interface section describes register programming and register reset in more detail.

SERIAL INTERFACE

The ADC has a set of internal registers, which can be accessed by the serial interface formed by pins SEN (Serial interface Enable), SCLK (Serial Interface Clock) and SDATA (Serial Interface Data).

Serial shift of bits into the device is enabled when SEN is low. Serial data SDATA is latched at every falling edge of SCLK when SEN is active (low). The serial data is loaded into the register at every 16th SCLK falling edge when SEN is low. In case the word length exceeds a multiple of 16 bits, the excess bits are ignored. Data can be loaded in multiple of 16-bit words within a single active SEN pulse.

The first 8 bits form the register address and the remaining 8 bits are the register data. The interface can work with SCLK frequency from 20 MHz down to very low speeds (few Hertz) and also with non-50% SCLK duty cycle.

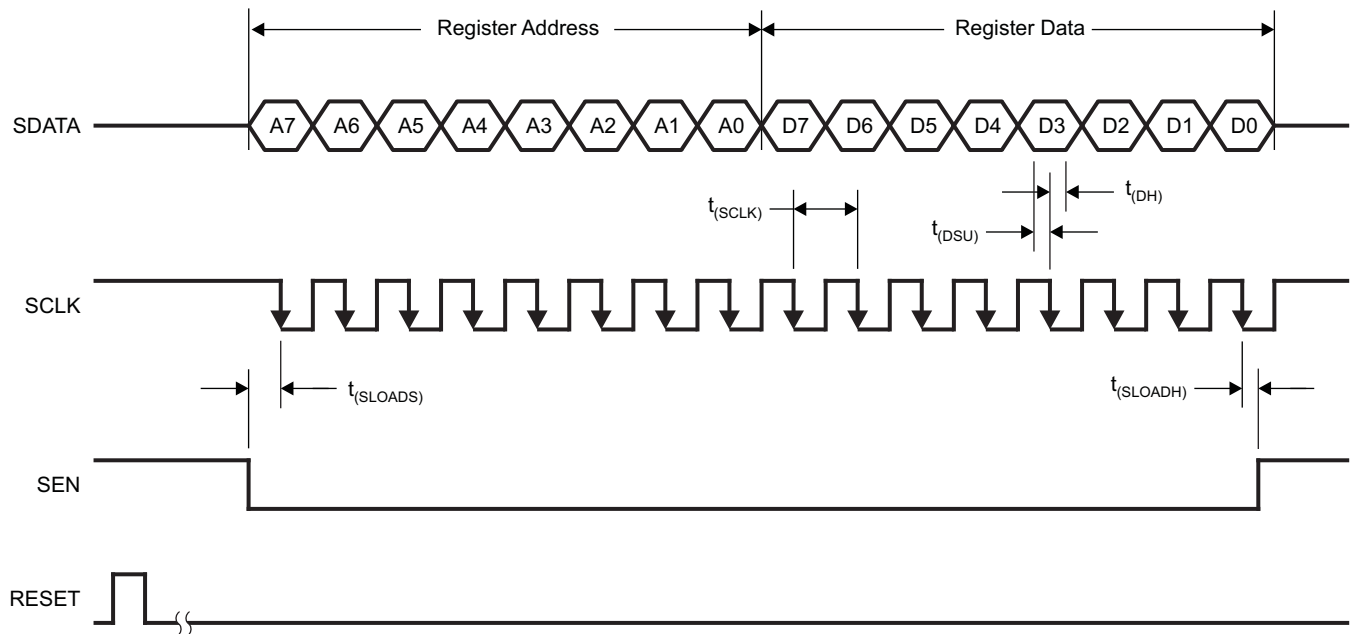

Register Initialization

After power-up, the internal registers MUST be initialized to their default values. This can be done in one of two ways:

1. Either through hardware reset by applying a high-going pulse on RESET pin (of width greater than 10ns) as shown in [Figure 8](#)

OR

2. By applying software reset. Using the serial interface, set the **<RESET>** bit (D7 in register 0x00) to HIGH. This initializes internal registers to their default values and then self-resets the **<RESET>** bit to **low**. In this case the RESET pin is kept **low**.

T0109-01

Figure 8. Serial Interface Timing

SERIAL INTERFACE TIMING CHARACTERISTICS

Typical values at 25°C, min and max values across the full temperature range $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = 85^{\circ}\text{C}$, $AVDD = 3.3\text{V}$, $DRVDD = 1.8\text{V}$ (unless otherwise noted).

PARAMETER		MIN	TYP	MAX	UNIT
f_{SCLK}	SCLK frequency ($= 1/t_{SCLK}$)	> DC		20	MHz
t_{SLOADS}	SEN to SCLK setup time	25			ns
t_{SLOADH}	SCLK to SEN hold time	25			ns
t_{DS}	SDATA setup time	25			ns
t_{DH}	SDATA hold time	25			ns

Serial Register Readout

The device includes an option where the contents of the internal registers can be read back. This may be useful as a diagnostic check to verify the serial interface communication between the external controller AND the ADC.

- First, set register bit <SERIAL READOUT> = 1. This also disables any further writes into the registers.
- Initiate a serial interface cycle specifying the address of the register (A7-A0) whose content has to be read.
- The device outputs the contents (D7-D0) of the selected register on the SDOUT pin (64).
- The external controller can latch the contents at the falling edge of SCLK.
- To enable register writes, reset register bit <SERIAL READOUT> = 0. SDOUT is a CMOS output pin; the readout functionality is available whether the ADC output data interface is LVDS or CMOS.

When <SERIAL READOUT> is disabled, the SDOUT pin is forced low by the device (and not put in high-impedance). If serial readout is not used, the SDOUT pin has to be floated.

T0386-02

Figure 9. Serial Readout

RESET TIMING (ONLY WHEN SERIAL INTERFACE IS USED)

Typical values at 25°C, min and max values across the full temperature range $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = 85^{\circ}\text{C}$ (unless otherwise noted).

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNIT
t_1 Power-on delay	Delay from power-up of AVDD and DRVDD to RESET pulse active	1			ms
t_2 Reset pulse width	Pulse width of active RESET signal	10			ns
				1 ⁽¹⁾	μs
t_3 Register write delay	Delay from RESET disable to SEN active	100			ns

(1) The reset pulse is needed only when using the serial interface configuration. If the pulse width is greater than 1 μsec , the device could enter the parallel configuration mode briefly and then return back to serial interface mode.

NOTE: A high-going pulse on RESET pin is required in serial interface mode in case of initialization through hardware reset. For parallel interface operation, RESET has to be tied permanently HIGH.

Figure 10. Reset Timing Diagram

VCM	23	1	IO	Internal reference mode – Common-mode voltage output. External reference mode – Reference input. The voltage forced on this pin sets the internal references.
RESET	12	1	I	Serial interface RESET input. When using the serial interface mode, the user must initialize internal registers through hardware RESET by applying a high-going pulse on this pin or by using software reset option. Refer to Serial Interface section.

PIN ASSIGNMENTS (LVDS MODE) – ADS62P49/P48 and ADS62P29/P28 (continued)

PIN		NO. OF PINS	I/O	DESCRIPTION
NAME	NO.			
				In parallel interface mode, the user has to tie RESET pin permanently high . (SCLK and SEN are used as parallel control pins in this mode) The pin has an internal 100 kΩ pull-down resistor.
SCLK	13	1	I	This pin functions as serial interface clock input when RESET is low . It controls selection of internal or external reference when RESET is tied high . See Table 4 for detailed information. The pin has an internal 100 kΩ pull-down resistor.
SDATA	14	1	I	Serial interface data input. The pin has an internal 100kΩ pull-down resistor. It has no function in parallel interface mode and can be tied to ground.
SEN	15	1	I	This pin functions as serial interface enable input when RESET is low . It controls selection of data format and interface type when RESET is tied high. See Table 5 for detailed information. The pin has an internal 100 kΩ pull-up resistor to DRVDD
SDOUT	64	1	O	This pin functions as serial interface register readout, when the <SERIAL READOUT> bit is enabled. When <SERIAL READOUT> = 0, this pin forces logic LOW and is not 3-stated.
CTRL1	35	1	I	Digital control input pins. Together, they control various power down modes.

APPLICATION INFORMATION

THEORY OF OPERATION

The ADS62Px9/x8 is a family of high performance and low power dual channel 14-bit/12-bit A/D converters with sampling rates up to 250 MSPS.

At every falling edge of the input clock, the analog input signal of each channel is sampled simultaneously. The sampled signal in each channel is converted by a pipeline of low resolution stages. In each stage, the sampled and held signal is converted by a high speed, low resolution flash sub-ADC. The difference (residue) between the stage input and its quantized equivalent is gained and propagates to the next stage.

At every clock, each succeeding stage resolves the sampled input with greater accuracy. The digital outputs from all stages are combined in a digital correction logic block and processed digitally to create the final code, after a data latency of 22 clock cycles.

The digital output is available as either DDR LVDS or parallel CMOS and coded in either straight offset binary or binary 2s complement format.

The dynamic offset of the first stage sub-ADC limits the maximum analog input frequency to about 500MHz (with 2V pp amplitude) and about 800MHz (with 1V pp amplitude).

ANALOG INPUT

The analog input consists of a switched-capacitor based differential sample and hold architecture. This differential topology results in very good AC performance even for high input frequencies at high sampling rates. The INP and INM pins have to be externally biased around a common-mode voltage of 1.5V, available on VCM pin. For a full-scale differential input, each input pin INP, INM has to swing symmetrically between $V_{CM} + 0.5V$ and $V_{CM} - 0.5V$, resulting in a 2Vpp differential input swing.

The input sampling circuit has a high 3-dB bandwidth that extends up to 700 MHz (measured from the input pins to the sampled voltage).

S0322-03

Figure 93. Analog Input Circuit

Drive Circuit Requirements

For optimum performance, the analog inputs must be driven differentially. This improves the common-mode noise immunity and even order harmonic rejection. A 5-Ω to 15-Ω resistor in series with each input pin is recommended to damp out ringing caused by package parasitic.

SFDR performance can be limited due to several reasons - the effect of sampling glitches (described below), non-linearity of the sampling circuit and non-linearity of the quantizer that follows the sampling circuit. Depending on the input frequency, sample rate and input amplitude, one of these plays a dominant part in limiting performance.

At very high input frequencies (> about 300 MHz), SFDR is determined largely by the device's sampling circuit non-linearity. At low input amplitudes, the quantizer non-linearity usually limits performance.

Glitches are caused by the opening and closing of the sampling switches. The driving circuit should present a low source impedance to absorb these glitches. Otherwise, this could limit performance, mainly at low input frequencies (up to about 200 MHz). It is also necessary to present low impedance (< 50 Ω) for the common mode switching currents. This can be achieved by using two resistors from each input terminated to the common mode voltage (VCM).

The device includes an internal R-C filter from each input to ground. The purpose of this filter is to absorb the sampling glitches inside the device itself. The cut-off frequency of the R-C filter involves a trade-off. A lower cut-off frequency (larger C) absorbs glitches better, but it reduces the input bandwidth. On the other hand, with a higher cut-off frequency (smaller C), bandwidth support is maximized. But now, the sampling glitches need to be supplied by the external drive circuit. This has limitations due to the presence of the package bond-wire inductance.

In ADS62PXX, the R-C component values have been optimized while supporting high input bandwidth (up to 700 MHz). However, in applications with input frequencies up to 200-300MHz, the filtering of the glitches can be improved further using an external R-C-R filter (as shown in [Figure 96](#) and [Figure 97](#)).

In addition to the above, the drive circuit may have to be designed to provide a low insertion loss over the desired frequency range and matched impedance to the source. While doing this, the ADC input impedance must be considered. [Figure 94](#) and [Figure 95](#) show the impedance ($Z_{in} = R_{in} \parallel C_{in}$) looking into the ADC input pins.

Figure 94. ADC Analog Input Resistance (R_{in}) Across Frequency

Figure 95. ADC Analog Input Capacitance (C_{in}) Across Frequency

Driving Circuit

Two example driving circuit configurations are shown in [Figure 96](#) and [Figure 97](#) one optimized for low bandwidth (low input frequencies) and the other one for high bandwidth to support higher input frequencies.

In [Figure 96](#), an external R-C-R filter using 22 pF has been used. Together with the series inductor (39 nH), this combination forms a filter and absorbs the sampling glitches. Due to the large capacitor (22 pF) in the R-C-R and the 15-Ω resistors in series with each input pin, the drive circuit has low bandwidth and supports low input frequencies (< 100MHz).

To support higher input frequencies (up to about 300 MHz, see [Figure 97](#)), the capacitance used in the R-C-R is reduced to 3.3 pF and the series inductors are shorted out. Together with the lower series resistors (5 Ω), this drive circuit provides high bandwidth and supports high input frequencies. Transformers such as ADT1-1WT or ETC1-1-13 can be used up to 300MHz.

Without the external R-C-R filter, the drive circuit has very high bandwidth and can support very high input frequencies (> 300MHz). For example, a transmission line transformer such as ADTL2-18 can be used (see [Figure 98](#)).

Note that both the drive circuits have been terminated by 50 Ω near the ADC side. The termination is accomplished by a 25-Ω resistor from each input to the 1.5-V common-mode (VCM) from the device. This allows the analog inputs to be biased around the required common-mode voltage.

The mismatch in the transformer parasitic capacitance (between the windings) results in degraded even-order harmonic performance. Connecting two identical RF transformers back to back helps minimize this mismatch and good performance is obtained for high frequency input signals. An additional termination resistor pair may be required between the two transformers as shown in the figures. The center point of this termination is connected to ground to improve the balance between the P and M side. The values of the terminations between the transformers and on the secondary side have to be chosen to get an effective 50 Ω (in the case of 50-Ω source impedance).

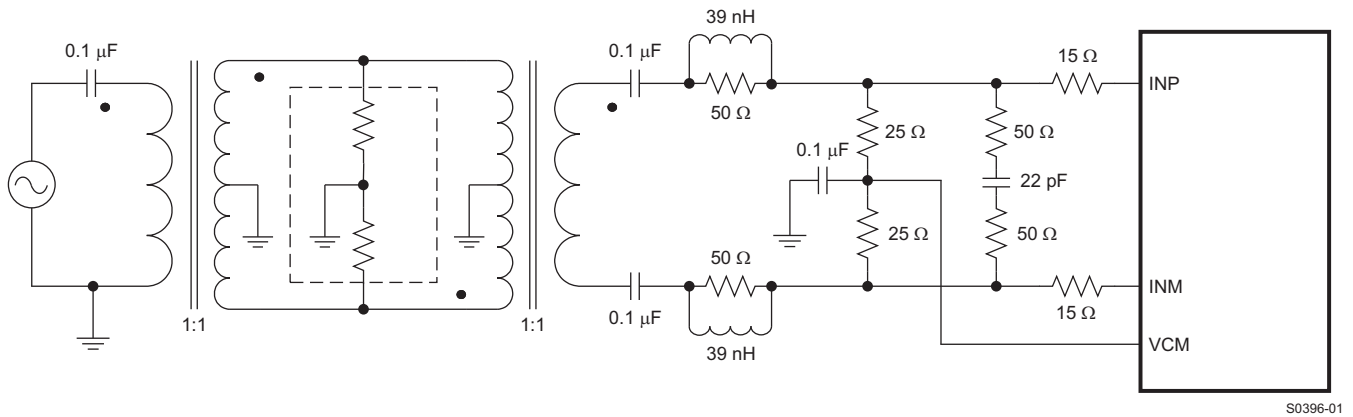

Figure 96. Drive Circuit With Low Bandwidth (for low input frequencies)

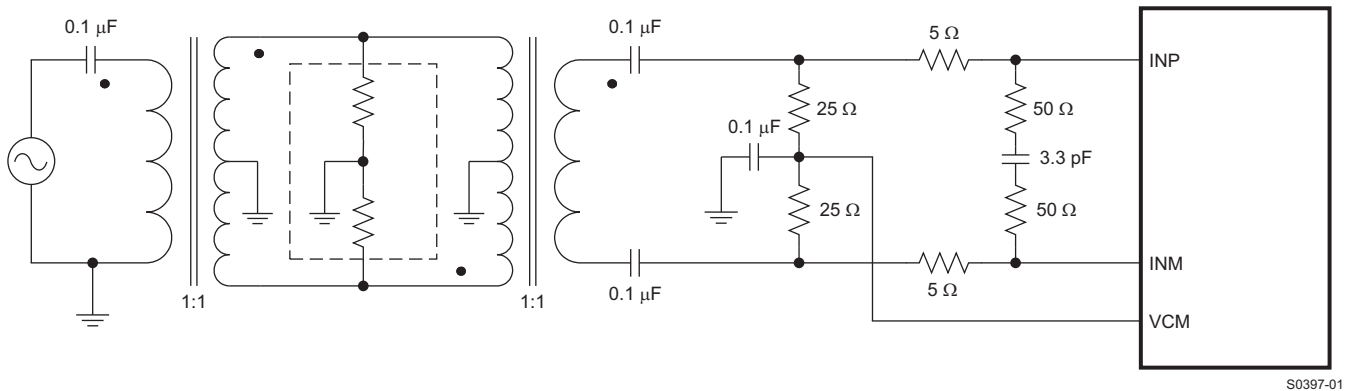

Figure 97. Drive Circuit With High Bandwidth (for high input frequencies)

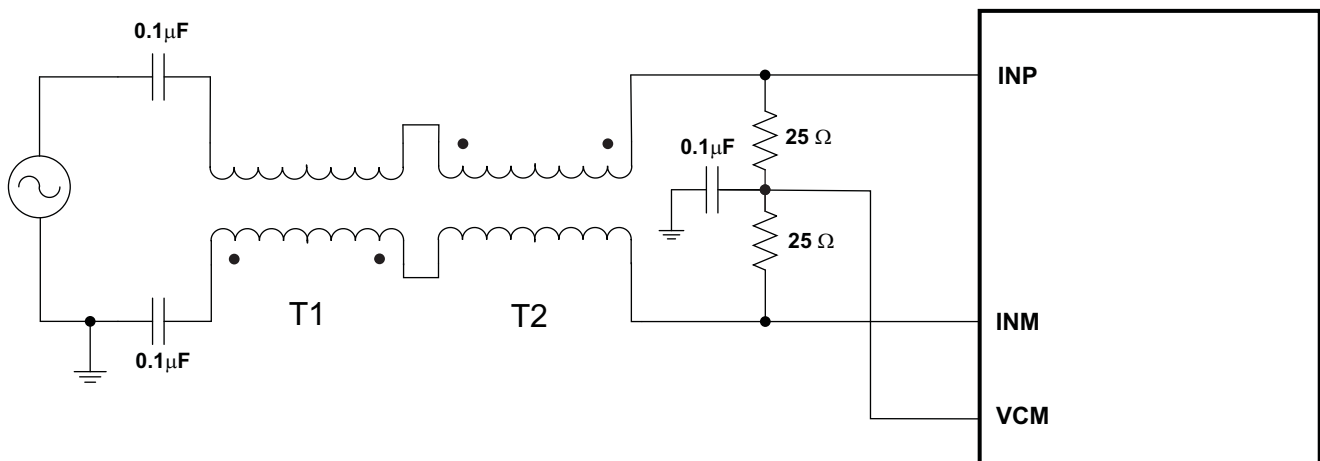

Figure 98. Drive Circuit with Very High Bandwidth (> 300 MHz)

All these examples show 1:1 transformers being used with a 50-Ω source. As explained in the “Drive Circuit Requirements”, this helps to present a low source impedance to absorb the sampling glitches. With a 1:4 transformer, the source impedance will be 200 ohms. The higher impedance can lead to degradation in performance, compared to the case with 1:1 transformers.

For applications where only a band of frequencies are used, the drive circuit can be tuned to present a low impedance for the sampling glitches. Figure 99 shows an example with 1:4 transformer, tuned for a band around 150 MHz.

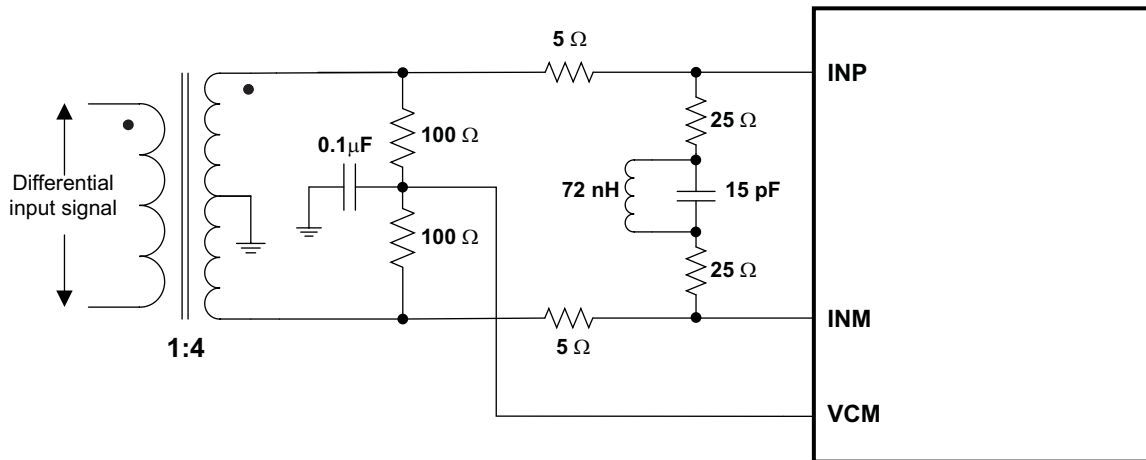

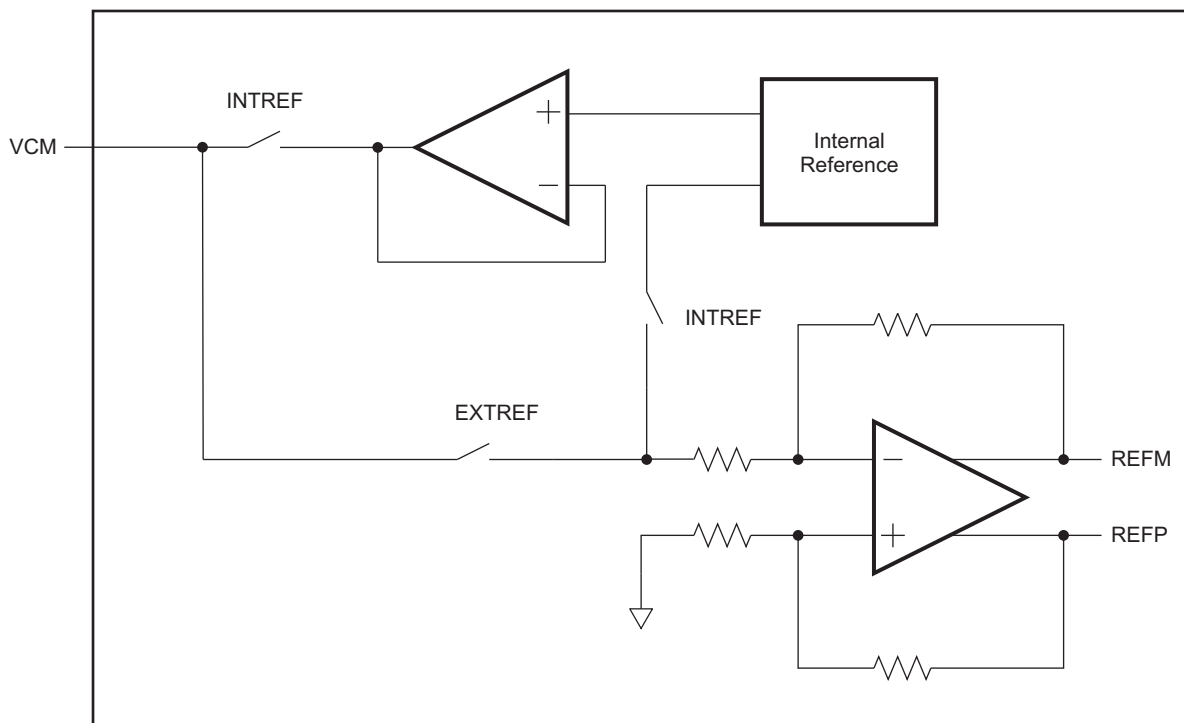

Figure 99. Drive Circuit with 1:4 Transformer

Input Common-Mode

To ensure a low-noise common-mode reference, the VCM pin is filtered with a 0.1 μF low-inductance capacitor connected to ground. The VCM pin is designed to directly drive the ADC inputs. The input stage of the ADC sinks a common-mode current in the order of 3.6 μA / MSPS (about 900 μA at 250 MSPS).

REFERENCE

The ADS62Px9/x8 has built-in internal references REFP and REFM, requiring no external components. Design schemes are used to linearize the converter load seen by the references; this and the on-chip integration of the requisite reference capacitors eliminates the need for external decoupling. The full-scale input range of the converter can be controlled in the external reference mode as explained below. The internal or external reference modes can be selected by programming the serial interface register bit <REF>.

S0165-09

Figure 100. Reference Section

Internal Reference

When the device is in internal reference mode, the REFP and REFM voltages are generated internally. Common-mode voltage (1.5V nominal) is output on VCM pin, which can be used to externally bias the analog input pins.

External Reference

When the device is in external reference mode, the VCM acts as a reference input pin. The voltage forced on the VCM pin is buffered and gained by 1.33 internally, generating the REFP and REFM voltages. The differential input voltage corresponding to full-scale is given by the following:

$$\text{Full-scale differential input pp} = (\text{Voltage forced on VCM}) \times 1.33$$

In this mode, the 1.5V common-mode voltage to bias the input pins has to be generated externally.

CLOCK INPUT

The ADS62Px9/x8 clock inputs can be driven differentially (sine, LVPECL or LVDS) or single-ended (LVCMOS), with little or no difference in performance between them. The common-mode voltage of the clock inputs is set to VCM using internal 5-kΩ resistors as shown in Figure 101. This allows using transformer-coupled drive circuits for sine wave clock or ac-coupling for LVPECL, LVDS clock sources (Figure 102 and Figure 103).

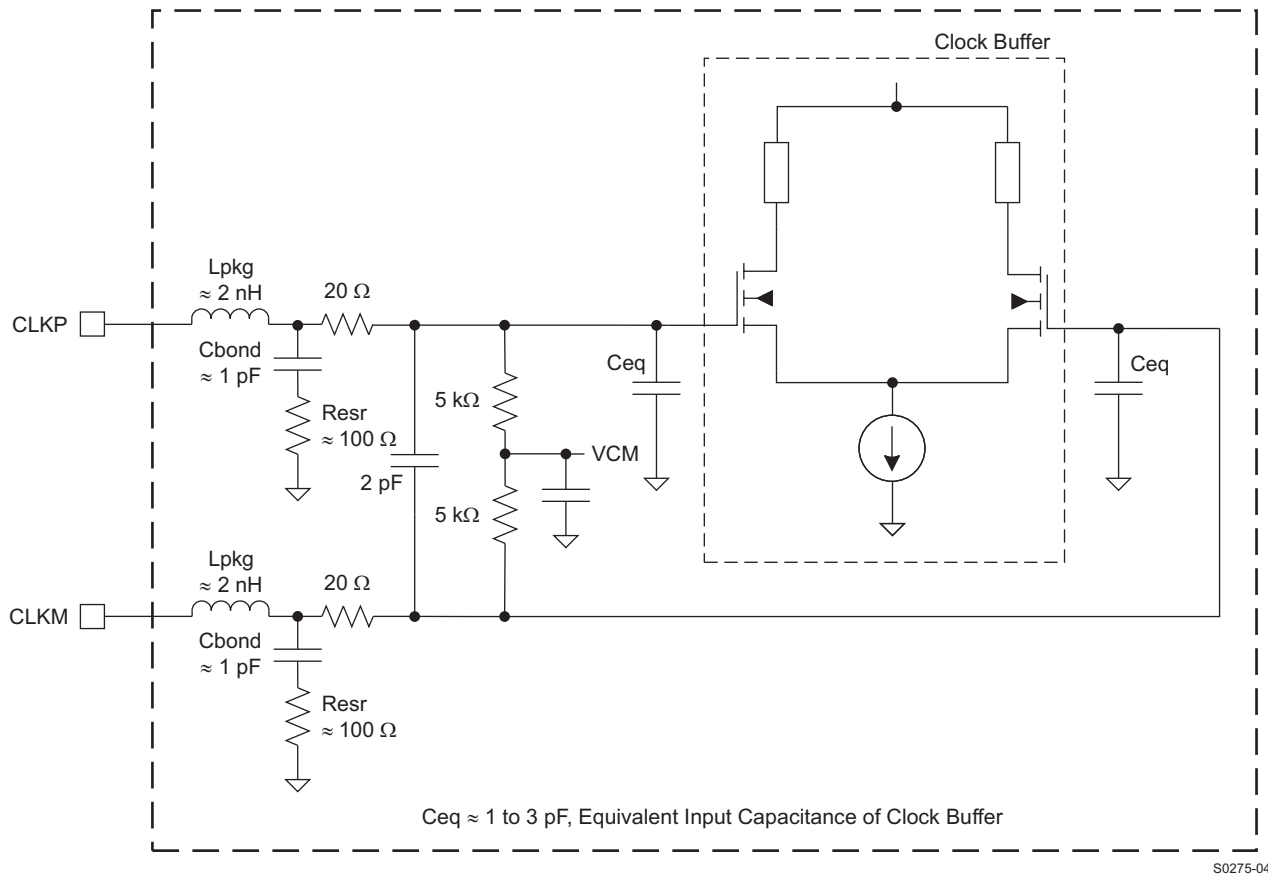

Figure 101. Internal Clock Buffer

Single-ended CMOS clock can be ac-coupled to the CLKP input, with CLKM (pin 11) connected to ground with a 0.1-μF capacitor, as shown in Figure 103.

For best performance, the clock inputs have to be driven differentially, reducing susceptibility to common-mode noise. For high input frequency sampling, it is recommended to use a clock source with very low jitter. Bandpass filtering of the clock source can help reduce the effect of jitter. There is no change in performance with a non-50% duty cycle clock input.

Figure 102. Differential Clock Driving Circuit

Figure 103. Single-Ended Clock Driving Circuit

GAIN PROGRAMMABILITY

The ADS62Px9/x8 includes gain settings that can be used to get improved SFDR performance (compared to no gain). The gain is programmable from 0dB to 6dB (in 0.5 dB steps). For each gain setting, the analog input full-scale range scales proportionally, as shown in [Table 8](#).

The SFDR improvement is achieved at the expense of SNR; for each 1dB gain step, the SNR degrades about 1dB. The SNR degradation is less at high input frequencies. As a result, the gain is very useful at high input frequencies as the SFDR improvement is significant with marginal degradation in SNR.

So, the gain can be used to trade-off between SFDR and SNR. Note that the default gain after reset is 0dB.

Table 8. Full-Scale Range Across Gains

GAIN, dB	TYPE	FULL-SCALE, V _{pp}
0	Default after reset	2 V
1	Fine, programmable	1.78
2		1.59
3		1.42
4		1.26
5		1.12
6		1.00

OFFSET CORRECTION

The ADS62Px9/x8 has an internal offset correction algorithm that estimates and corrects dc offset up to ±10mV. The correction can be enabled using the serial register bit **<ENABLE OFFSET CORRECTION>**. Once enabled, the algorithm estimates the channel offset and applies the correction every clock cycle. The time constant of the correction loop is a function of the sampling clock frequency. The time constant can be controlled using register bits **<OFFSET CORR TIME CONSTANT>** as described in [Table 9](#).

After the offset is estimated, the correction can be frozen by setting **<ENABLE OFFSET CORRECTION>** back to 0.

Once frozen, the last estimated value is used for offset correction every clock cycle. The correction does not affect the phase of the signal. Note that offset correction is disabled by default after reset.

[Figure 104](#) shows the time response of the offset correction algorithm, after it is enabled.

Table 9. Time Constant of Offset Correction Algorithm

POWER DOWN

The ADS62Px9/x8 has two power down modes – global power down and individual channel standby. These can be set using either the serial register bits or using the control pins CTRL1 to CTRL3.

POWER DOWN MODES	CONFIGURE USING				WAKE-UP TIME
	SERIAL INTERFACE	PARALLEL CONTROL PINS			
Normal operation	<POWER DOWN MODES> = 0000	low	low	low	–
Output buffer disabled for channel B	<POWER DOWN MODES> = 1001	low	low	high	–
Output buffer disabled for channel A	<POWER DOWN MODES> = 1010	low	high	low	–
Output buffer disabled for channel A and B	<POWER DOWN MODES> = 1011	low	high	high	–
Global power down	<POWER DOWN MODES> = 1100	high	low	low	Slow (30 μs)
Channel B standby	<POWER DOWN MODES> = 1101	high	low	high	Fast (1 μs)
Channel A standby	<POWER DOWN MODES> = 1110	high	high	low	Fast (1 μs)
Multiplexed (MUX) mode – Output data of channel A and B is multiplexed and available on DA13 to DA0 pins.	<POWER DOWN MODES> = 1111	high	high	high	–

Global Power Down

In this mode, the entire chip including both the A/D converters, internal reference and the output buffers are powered down resulting in reduced total power dissipation of about 45 mW. The output buffers are in high impedance state. The wake-up time from the global power down to data becoming valid in normal mode is typically 30μs.

Channel Standby

Here, each channel's A/D converter can be powered down. The internal references are active, resulting in quick wake-up time of 1 μs. The total power dissipation in standby is about 475 mW.

Input Clock Stop

In addition to the above, the converter enters a low-power mode when the input clock frequency falls below 1 MSPS. The power dissipation is about 275 mW.

POWER SUPPLY SEQUENCE

During power-up, the AVDD and DRVDD supplies can come up in any sequence. The two supplies are separated in the device. Externally, they can be driven from separate supplies or from a single supply.

DIGITAL OUTPUT INFORMATION

The ADS62Px9/x8 provides 14-bit/12-bit data and an output clock synchronized with the data.

Output Interface

Two output interface options are available – Double Data Rate (DDR) LVDS and parallel CMOS. They can be selected using the serial interface register bit <LVDS_CMOS> or using DFS pin in parallel configuration mode.

DDR LVDS Outputs

In this mode, the data bits and clock are output using LVDS (Low Voltage Differential Signal) levels. Two data bits are multiplexed and output on each LVDS differential pair.

S0398-01

Figure 105. LVDS Outputs

Even data bits D0, D2, D4... are output at the rising edge of CLKOUTP and the odd data bits D1, D3, D5... are output at the falling edge of CLKOUTP. Both the rising and falling edges of CLKOUTP have to be used to capture all the data bits (SEE [Figure 106](#)).

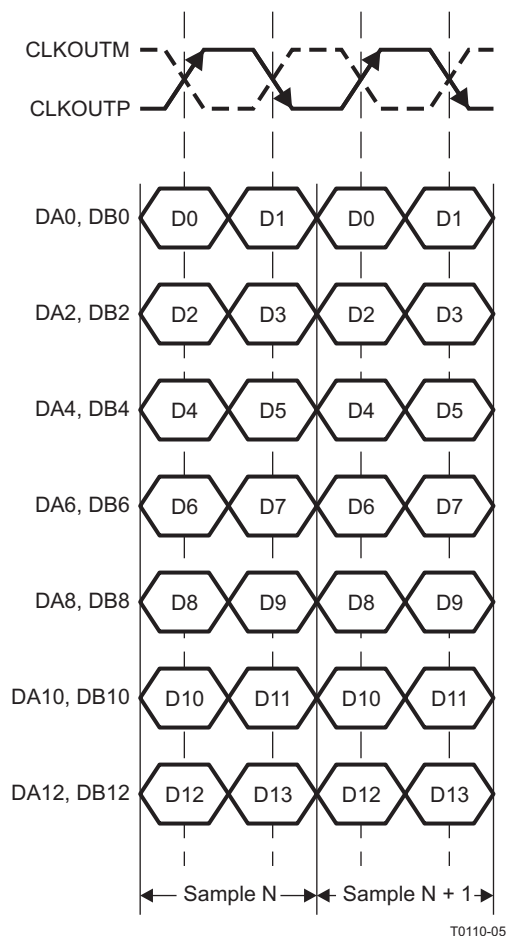

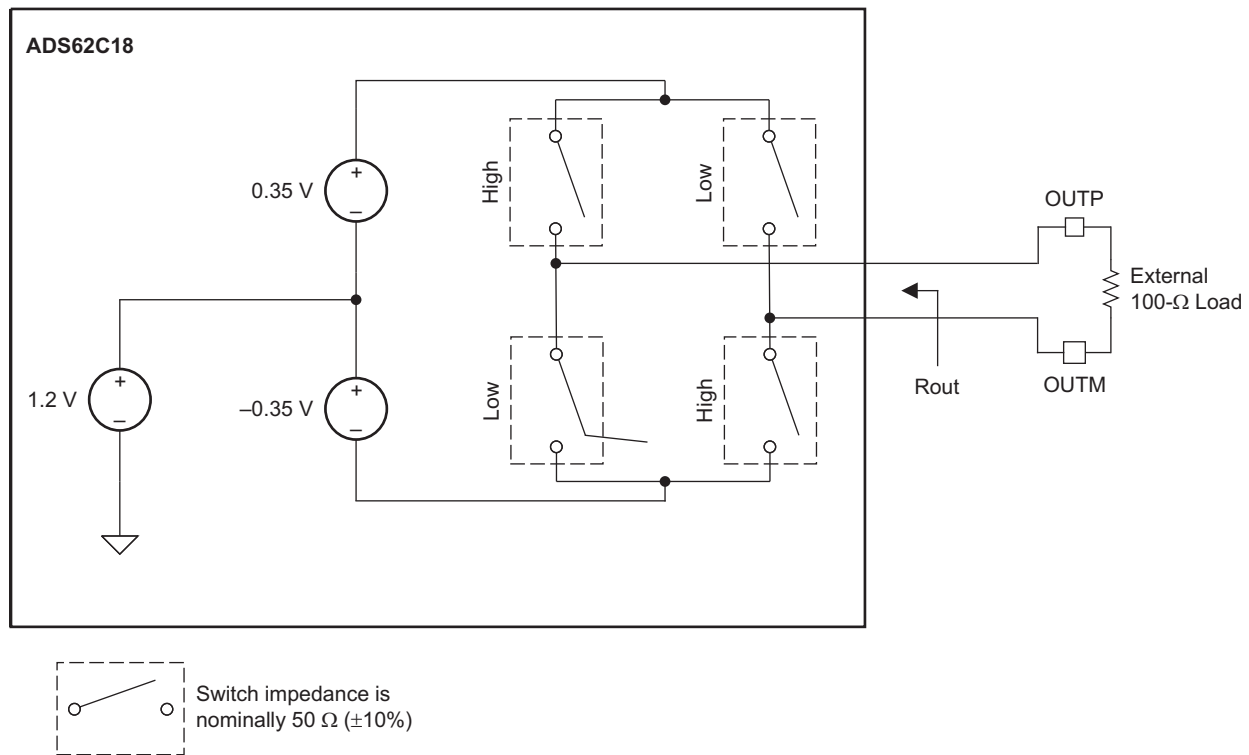

Figure 106. DDR LVDS Interface

LVDS Buffer

The equivalent circuit of each LVDS output buffer is shown in [Figure 107](#). The buffer is designed to present an output impedance of 100 Ω (Rout). The differential outputs can be terminated at the receive end by a 100- Ω termination.

The buffer output impedance behaves like a source-side series termination. By absorbing reflections from the receiver end, it helps to improve signal integrity. Note that this internal termination cannot be disabled and its value cannot be changed.

When the High switches are closed, OUTP = 1.375 V, OUTM = 1.025 V
When the Low switches are closed, OUTP = 1.025 V, OUTM = 1.375 V
When the High (or Low) switches are closed, Rout = 100 Ω

S0374-03

Figure 107. LVDS Buffer Equivalent Circuit

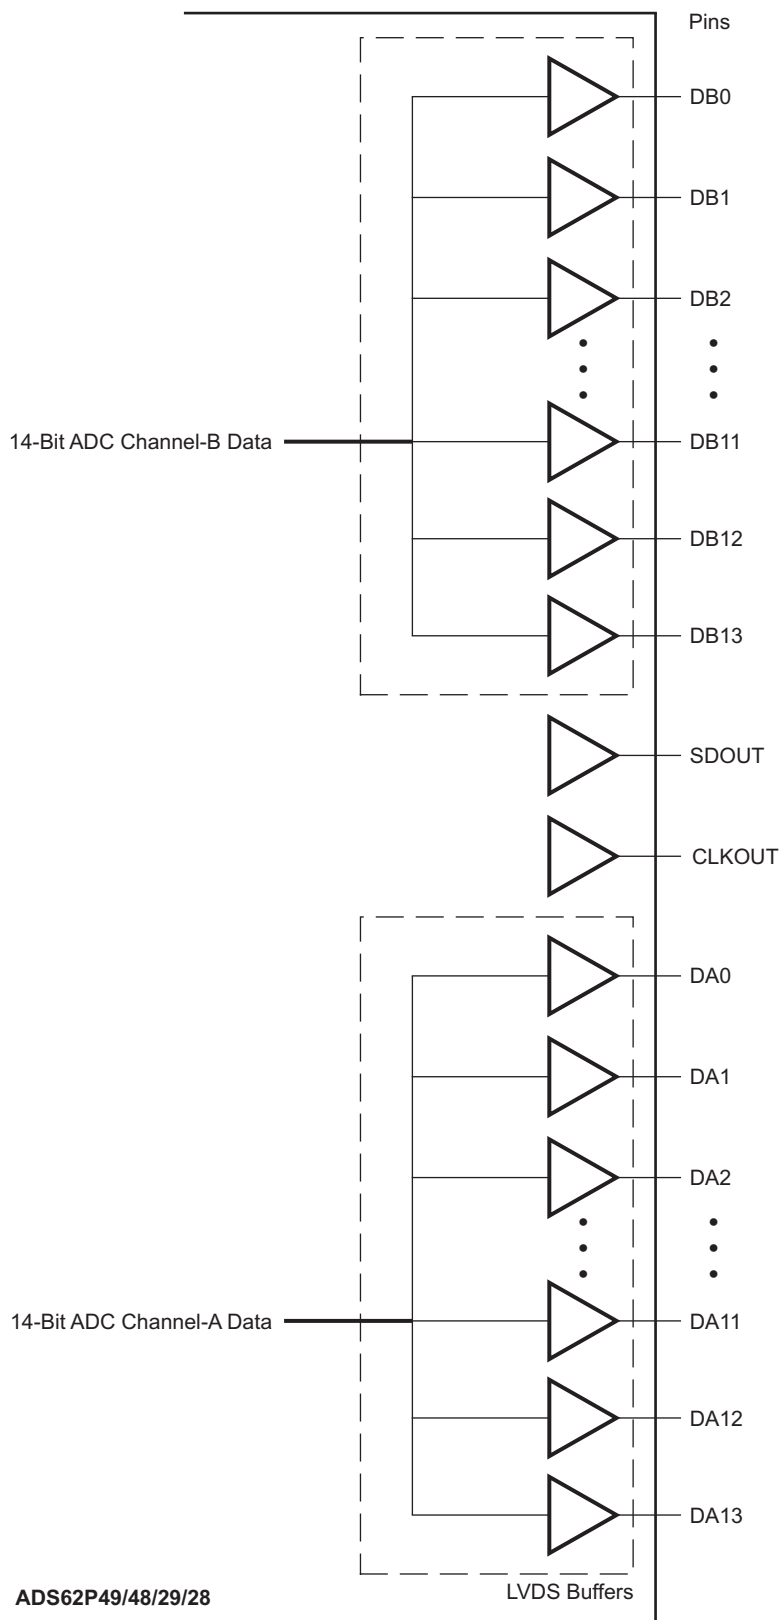

Parallel CMOS Interface

In CMOS mode, each data bit is output on a separate pin as a CMOS voltage level, every clock cycle. This mode is recommended only up to 210 MSPS, beyond which the CMOS data outputs do not have sufficient time to settle to valid logic levels.

For sampling frequencies up to 150 MSPS, the rising edge of the output clock CLKOUT can be used to latch data in the receiver. The setup and hold timings of the output data with respect to CLKOUT are specified in the timing specification table up to 150 MSPS.

For sampling frequencies above 150 MSPS, it is recommended to use an external clock to capture data. The delay from input clock to output data and the data valid times are specified up to 210 MSPS. These timings can be used to delay the input clock appropriately and use it to capture the data.

When using the CMOS interface, it is important to minimize the load capacitance seen by data and clock output pins by using short traces on the board.

S0399-01

Figure 108. CMOS Outputs

CMOS Interface Power Dissipation

With CMOS outputs, the DRVDD current scales with the sampling frequency and the load capacitance on every output pin. The maximum DRVDD current occurs when each output bit toggles between 0 and 1 every clock cycle. In actual applications, this condition is unlikely to occur. The actual DRVDD current would be determined by the average number of output bits switching, which is a function of the sampling frequency and the nature of the analog input signal.

$$\text{Digital current due to CMOS output switching} = C_L \times \text{DRVDD} \times (N \times F_{\text{AVG}}),$$

where

C_L = load capacitance,

$N \times F_{\text{AVG}}$ = average number of output bits switching.

[Figure 86](#) shows the current with various load capacitances across sampling frequencies at 2.5-MHz analog input frequency

Multiplexed Output Mode (only with CMOS interface)

In this mode, the digital outputs of both the channels are multiplexed and output on a single bus (DA0-DA13 pins). The channel B output pins (DB0-DB13) are 3-stated. Since the output data rate on the DA bus is effectively doubled, this mode is recommended only for low sampling frequencies (<65MSPS).

This mode can be enabled using register bits **<POWER DOWN MODES>** or using the parallel pins CTRL1-3.

Output Data Format

Two output data formats are supported – 2s complement and offset binary. They can be selected using the serial interface register bit **<DATA FORMAT>** or controlling the DFS pin in parallel configuration mode.

In the event of an input voltage overdrive, the digital outputs go to the appropriate full scale level. For a positive overdrive, the output code is 0x3FFF in offset binary output format, and 0x1FFF in 2s complement output format. For a negative input overdrive, the output code is 0x0000 in offset binary output format and 0x2000 in 2s complement output format.

BOARD DESIGN CONSIDERATIONS

Grounding

A single ground plane is sufficient to give good performance, provided the analog, digital, and clock sections of the board are cleanly partitioned. See the EVM User Guide ([SLAU237](#)) for details on layout and grounding.

Supply Decoupling

As ADS62Px9/x8 already includes internal decoupling, minimal external decoupling can be used without loss in performance. Note that decoupling capacitors can help filter external power supply noise, so the optimum number of capacitors would depend on the actual application. The decoupling capacitors should be placed very close to the converter supply pins.

Exposed Pad

In addition to providing a path for heat dissipation, the pad is also electrically connected to digital ground internally. So, it is necessary to solder the exposed pad to the ground plane for best thermal and electrical performance. For detailed information, see application notes *QFN Layout Guidelines* ([SLOA122](#)) and *QFN/SON PCB Attachment* ([SLUA271](#)).

DEFINITION OF SPECIFICATIONS

Analog Bandwidth – The analog input frequency at which the power of the fundamental is reduced by 3 dB with respect to the low frequency value.

Aperture Delay – The delay in time between the rising edge of the input sampling clock and the actual time at which the sampling occurs. This delay will be different across channels. The maximum variation is specified as aperture delay variation (channel-channel).

Aperture Uncertainty (Jitter) – The sample-to-sample variation in aperture delay.

Clock Pulse Width/Duty Cycle – The duty cycle of a clock signal is the ratio of the time the clock signal remains at a logic high (clock pulse width) to the period of the clock signal. Duty cycle is typically expressed as a percentage. A perfect differential sine-wave clock results in a 50% duty cycle.

Maximum Conversion Rate – The maximum sampling rate at which certified operation is given. All parametric testing is performed at this sampling rate unless otherwise noted.

Minimum Conversion Rate – The minimum sampling rate at which the ADC functions.

Differential Nonlinearity (DNL) – An ideal ADC exhibits code transitions at analog input values spaced exactly 1 LSB apart. The DNL is the deviation of any single step from this ideal value, measured in units of LSBs.

Integral Nonlinearity (INL) – The INL is the deviation of the ADC's transfer function from a best fit line determined by a least squares curve fit of that transfer function, measured in units of LSBs.

Gain Error – Gain error is the deviation of the ADC's actual input full-scale range from its ideal value. The gain error is given as a percentage of the ideal input full-scale range. Gain error has two components: error due to reference inaccuracy and error due to the channel. Both these errors are specified independently as E_{GREF} and E_{GCHAN} .

To a first order approximation, the total gain error will be $E_{TOTAL} \sim E_{GREF} + E_{GCHAN}$.

For example, if $E_{TOTAL} = \pm 0.5\%$, the full-scale input varies from $(1 - 0.5/100) \times FS_{ideal}$ to $(1 + 0.5/100) \times FS_{ideal}$.

Offset Error – The offset error is the difference, given in number of LSBs, between the ADC's actual average idle channel output code and the ideal average idle channel output code. This quantity is often mapped into mV.

Temperature Drift – The temperature drift coefficient (with respect to gain error and offset error) specifies the change per degree Celsius of the parameter from T_{MIN} to T_{MAX} . It is calculated by dividing the maximum deviation of the parameter across the T_{MIN} to T_{MAX} range by the difference $T_{MAX} - T_{MIN}$.

Signal-to-Noise Ratio – SNR is the ratio of the power of the fundamental (PS) to the noise floor power (PN), excluding the power at DC and the first nine harmonics.

$$SNR = 10 \log_{10} \frac{P_S}{P_N} \quad (1)$$

SNR is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

Signal-to-Noise and Distortion (SINAD) – SINAD is the ratio of the power of the fundamental (P_S) to the power of all the other spectral components including noise (P_N) and distortion (P_D), but excluding dc.

$$SINAD = 10 \log_{10} \frac{P_S}{P_N + P_D} \quad (2)$$

SINAD is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

Effective Number of Bits (ENOB) – The ENOB is a measure of the converter performance as compared to the theoretical limit based on quantization noise.

$$\text{ENOB} = \frac{\text{SINAD} - 1.76}{6.02} \quad (3)$$

Total Harmonic Distortion (THD) – THD is the ratio of the power of the fundamental (P_S) to the power of the first nine harmonics (P_N).

$$\text{THD} = 10\log^{10} \frac{P_S}{P_N} \quad (4)$$

THD is typically given in units of dBc (dB to carrier).

Spurious-Free Dynamic Range (SFDR) – The ratio of the power of the fundamental to the highest other spectral component (either spur or harmonic). SFDR is typically given in units of dBc (dB to carrier).

Two-Tone Intermodulation Distortion – IMD3 is the ratio of the power of the fundamental (at frequencies f_1 and f_2) to the power of the worst spectral component at either frequency $2f_1-f_2$ or $2f_2-f_1$. IMD3 is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

DC Power Supply Rejection Ratio (DC PSRR) – The DC PSRR is the ratio of the change in offset error to a change in analog supply voltage. The DC PSRR is typically given in units of mV/V.

AC Power Supply Rejection Ratio (AC PSRR) – AC PSRR is the measure of rejection of variations in the supply voltage by the ADC. If ΔV_{SUP} is the change in supply voltage and ΔV_{OUT} is the resultant change of the ADC output code (referred to the input), then

$$\text{PSRR} = 20\log^{10} \frac{\Delta V_{OUT}}{\Delta V_{SUP}} \quad (\text{Expressed in dBc}) \quad (5)$$

Voltage Overload Recovery – The number of clock cycles taken to recover to less than 1% error after an overload on the analog inputs. This is tested by separately applying a sine wave signal with 6dB positive and negative overload. The deviation of the first few samples after the overload (from their expected values) is noted.

Common Mode Rejection Ratio (CMRR) – CMRR is the measure of rejection of variation in the analog input common-mode by the ADC. If ΔV_{CM_in} is the change in the common-mode voltage of the input pins and ΔV_{OUT} is the resultant change of the ADC output code (referred to the input), then

$$\text{CMRR} = 20\log^{10} \frac{\Delta V_{OUT}}{\Delta V_{CM}} \quad (\text{Expressed in dBc}) \quad (6)$$

Cross-Talk (only for multi-channel ADC)– This is a measure of the internal coupling of a signal from adjacent channel into the channel of interest. It is specified separately for coupling from the immediate neighboring channel (near-channel) and for coupling from channel across the package (far-channel). It is usually measured by applying a full-scale signal in the adjacent channel. Cross-talk is the ratio of the power of the coupling signal (as measured at the output of the channel of interest) to the power of the signal applied at the adjacent channel input. It is typically expressed in dBc.

REVISION HISTORY

Changes from Original (April 2009) to Revision A	Page
• Changed ADS62P48, ADS62P29, ADS62P28 from product preview to production data	4
• Added Analog supply current max value of 320 mA	6
• Added Output buffer supply current, LVDS interface max value of 165 mA	6
• Added Analog power max value of 1.05 W	6
• Added Digital power, LVDS interface max value of 0.3 W	6
• Added SNR Signal to noise ratio,LVDS, Fin = 170 MHz, 0 dB gain min value of 68 dBFS.....	7
• Added SINADSignal to noise and distortion ratio, LVDS, Fin = 170 MHz, 0 dB gain min value of 66.5 dBFS.....	7
• Added SNR Signal to noise ratio,LVDS, Fin = 170 MHz, 0 dB gain min value of 66.5 dBFS.....	7
• Added SNR Signal to noise ratio,LVDS, Fin = 170 MHz, 0 dB gain min value of 66.5 dBFS.....	7
• Added SINADSignal to noise and distortion ratio, LVDS, Fin = 170 MHz, 0 dB gain min value of 66 dBFS.....	7
• Added SINADSignal to noise and distortion ratio, LVDS, Fin = 170 MHz, 0 dB gain min value of 66 dBFS.....	7
• Added DNL Differential non-linearity min value of –0.9 LSB	7
• Added DNL Differential non-linearity max value of 1.3 LSB	7
• Added DNL Differential non-linearity min value of –0.9 LSB	7
• Added DNL Differential non-linearity max value of 1.3 LSB	7
• Added INL Integrated non-linearity min value of –5 LSB	7
• Added INL Integrated non-linearity max value of 5 LSB	7
• Added INL Integrated non-linearity min value of –5 LSB	7
• Added INL Integrated non-linearity max value of 5 LSB	7
• Added SFDR Spurious Free Dynamic Range, Fin = 170 MHz min value of 71 dBc	8
• Added SFDRSpurious Free Dynamic Range, excluding HD2,HD3, Fin = 170 MHz min value of 78 dBc.....	8
• Added HD2 Second Harmonic Distortion, Fin = 170 MHz min value of 71 dBc.....	8
• Added HD3 Third Harmonic Distortion, Fin = 170 MHz min value of 71 dBc.....	8
• Added THDTTotal harmonic distortion, Fin = 170 MHz min value of 70.5 dBc.....	8
• Added IMD2-Tone Inter-modulation Distortion, F1 = 46 MHz, F2 = 50 MHz, each tone at –7 dBFS typ value of 91 dBFS	8
• Changed DB0-DB13 number of pins from 2 to 14.....	35

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

CUSTOM DEVICE

PLASTIC QUAD FLATPACK

4204106/D 08/04

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-leads (QFN) package configuration .
-  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

NOTE: All linear dimensions are in millimeters

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
