

### GENERAL DESCRIPTION

The ICS843011 is a Fibre Channel Clock Generator and a member of the HiPerClocks™ family of high performance devices from ICS. The ICS843011 uses a 26.5625MHz crystal to synthesize 106.25MHz or a 25MHz crystal to synthesize 100MHz. The ICS843011 has excellent <1ps phase jitter performance, over the 637KHz – 10MHz integration range. The ICS843011 is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

### FEATURES

- 1 differential 3.3V LVPECL output
- Crystal oscillator interface designed for 26.5625MHz 18pF parallel resonant crystal
- Output frequency: 106.25MHz or 100MHz
- VCO range: 560MHz - 680MHz
- RMS phase jitter @ 100MHz, using a 25MHz crystal (637KHz - 10MHz): 0.80ps (typical)
- RMS phase noise at 106.25MHz

Phase noise:

| Offset       | Noise Power   |
|--------------|---------------|
| 100Hz .....  | -92.8 dBc/Hz  |
| 1KHz .....   | -119.6 dBc/Hz |
| 10KHz .....  | -129.5 dBc/Hz |
| 100KHz ..... | -130.5 dBc/Hz |

- 3.3V operating supply
- Lead-Free package fully RoHS compliant
- -40°C to 85°C ambient operating temperature

### FREQUENCY TABLE

| Crystal (MHz) | Output Frequency (MHz) |
|---------------|------------------------|
| 26.5625       | 106.25                 |
| 25            | 100                    |

|-----------------|-------------------|-----------------|---------|---------|---------|-------|
| C <sub>IN</sub> | Input Capacitance |                 |         | 4       |         | pF    |

**ABSOLUTE MAXIMUM RATINGS**

|  |                          |
|--|--------------------------|
| Supply Voltage, $V_{CC}$                 | 4.6V                     |
| Inputs, $V_i$                            | -0.5V to $V_{CC} + 0.5V$ |
| Outputs, $I_o$                           |                          |
| Continuous Current                       | 50mA                     |
| Surge Current                            | 100mA                    |
| Package Thermal Impedance, $\theta_{JA}$ | 101.7°C/W (0 mps)        |
| Storage Temperature, $T_{STG}$           | -65°C to 150°C           |

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

**TABLE 3A. POWER SUPPLY DC CHARACTERISTICS,  $V_{CC} = 3.3V \pm 5\%$ ,  $T_A = -40^\circ C$  TO  $85^\circ C$**

| Symbol    | Parameter             | Test Conditions      | Minimum | Typical | Maximum | Units |
|-----------|-----------------------|----------------------|---------|---------|---------|-------|

## APPLICATION INFORMATION

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS843011 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{CC}$ , and  $V_{CCA}$  should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a  $10\Omega$  resistor along with a  $10\mu\text{F}$  and a  $.01\mu\text{F}$  bypass capacitor should be connected to each  $V_{CCA}$  pin.

FIGURE 1. POWER SUPPLY FILTERING

### CRYSTAL INPUT INTERFACE

The ICS843011 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 26.5625MHz, 18pF par-

allel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

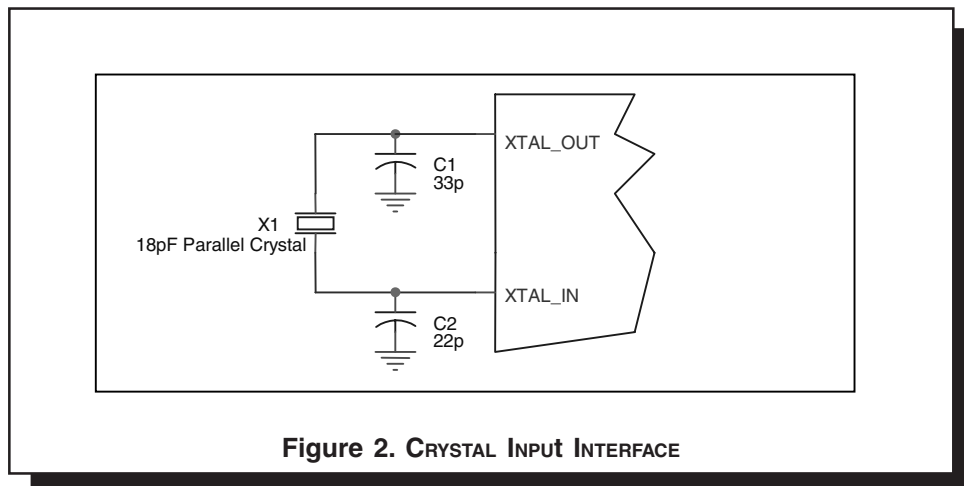

Figure 2. CRYSTAL INPUT INTERFACE

### APPLICATION SCHEMATIC

Figure 3A shows a schematic example of the ICS843011. An example of LVEPCL termination is shown in this schematic. Additional LVPECL termination approaches are shown in the LVPECL Termination Application Note. In this example, an 18 pF parallel resonant 26.5625MHz crystal is used for generating

106.25MHz output frequency. The C1 = 27pF and C2 = 33pF are recommended for frequency accuracy. For different board layout, the C1 and C2 values may be slightly adjusted for optimizing frequency accuracy.

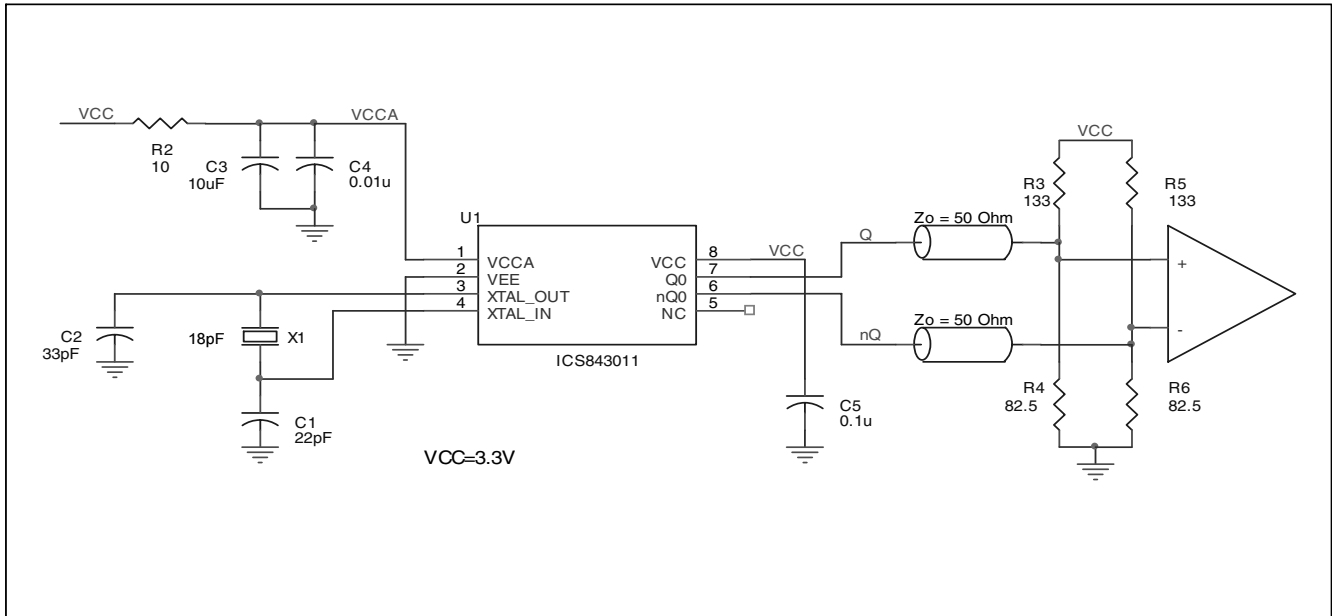

FIGURE 3A. ICS843011 SCHEMATIC EXAMPLE

### PC BOARD LAYOUT EXAMPLE

Figure 3B shows an example of ICS843011 P.C. board layout. The crystal X1 footprint shown in this example allows installation of either surface mount HC49S or through-hole HC49 package. The footprints of other components in this example are listed

in the Table 6. There should be at least one decoupling capacitor per power pin. The decoupling capacitors should be located as close as possible to the power pins. The layout assumes that the board has clean analog power ground plane.

FIGURE 3B. ICS843011 PC BOARD LAYOUT EXAMPLE

TABLE 6. FOOTPRINT TABLE

| Reference | Size |
|-----------|------|
| C1, C2    | 0402 |
| C3        | 0805 |
| C4, C5    | 0603 |
| R2        | 0603 |

NOTE: Table 6, lists component sizes shown in this layout example.

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS843011. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS843011 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 93mA = 322.2mW$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $322.2mW + 30mW = 352.2mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 90.5°C/W per Table 6 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$85°C + 0.352W * 90.5°C/W = 116.9°C$ . This is below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 8-PIN TSSOP, FORCED CONVECTION**

| $\theta_{JA}$ by Velocity (Meters per Second) |           |          |          |
|---|-----------|----------|----------|
|   | 0         | 1        | 2.5      |
| Multi-Layer PCB, JEDEC Standard Test Boards   | 101.7°C/W | 90.5°C/W | 89.8°C/W |

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 4*.

**FIGURE 4. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.9V$

$$(V_{CC\_MAX} - V_{OH\_MAX}) = 0.9V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.7V$

$$(V_{CC\_MAX} - V_{OL\_MAX}) = 1.7V$$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 30mW$
