17-V 1.5-A SYNCHRONOUS STEP-DOWN CONVERTER

Check for Samples: TPS62110-Q1

FEATURES

- **Qualified for Automotive Applications**
- **High-Efficiency Synchronous Step-Down Converter With up to 95% Efficiency**
- **3.1-V to 17-V Operating Input Voltage Range**
- **Adjustable Output Voltage Range From 1.2 V to 16 V**
- **Synchronizable to External Clock Signal up to 1.4 MHz**
- **Up to 1.5-A Output Current**
- **High Efficiency Over a Wide Load Current Range Due to PFM/PWM Operation Mode**
- **100% Maximum Duty Cycle for Lowest Dropout**
- **20-µA Quiescent Current (Typical)**
- **Overtemperature and Overcurrent Protected**
- **Available in 16 Pin QFN Package**

DESCRIPTION/ORDERING INFORMATION

The TPS62110 is a low-noise synchronous step-down dc-dc converter that is ideally suited for systems powered from a 2-cell Li-ion battery or from a 12-V or 15-V rail.

The TPS62110 is a synchronous PWM converter with integrated N-channel and P-channel power MOSFET switches. Synchronous rectification is used to increase efficiency and to reduce external component count. To achieve highest efficiency over a wide load current range, the converter enters a power-saving, pulse-frequency modulation (PFM) mode at light load currents. Operating frequency is typically 1 MHz, allowing the use of small inductor and capacitor values. The device can be synchronized to an external clock signal in the range of 0.8 MHz to 1.4 MHz. For low noise operation, the converter can be operated in PWM-only mode. In the shutdown mode, the current consumption is reduced to less than 2 µA. The TPS62110 is available in the 16-pin (RSA) QFN package and operates over a free-air temperature range of –40°C to 125°C.

ORDERING INFORMATION(1)

T_A	PACKAGE(2)		ORDERABLE PART NUMBER	TOP-SIDE MARKING
–40°C to 125°C	QFN – RSA	Reel of 3000	TPS62110QRSARQ1	TPS62110Q

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS(1)

over operating free-air temperature range (unless otherwise noted)

V_{CC}	Supply voltage at VIN, VINA	–0.3 V to 20 V
V_I	Voltage at SW	–0.3 V to V_I
	Voltage at EN, SYNC, LBO, PG	–0.3 V to 20 V
	Voltage at LBI, FB	–0.3 V to 7 V
I_O	Output current at SW	2400 mA
T_J	Maximum junction temperature	150°C
T_{stg}	Storage temperature	–65°C to 150°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

DISSIPATION RATINGS(1)

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
EN	4	I	Enable. A logic high enables the converter; logic low forces the device into shutdown mode reducing the supply current to less than 2 µA.
FB	10	I	An external resistive divider is connected to this pin to set the output voltage.
LBO	6	O	Open-drain low-battery output. This pin is pulled low if LBI is below its threshold.
GND	11, 12	I	Ground
LBI	7	I	Low-battery input
SW	14, 15	O	Connect the inductor to this pin. This pin is the switch pin and connected to the drain of the internal power MOSFETS.
PG	13	O	Power good comparator output. This is an open-drain output. A pullup resistor should be connected between PG and VOUT. The output goes active high when the output voltage is greater than 98.4% of the nominal value.
PGND	1, 16	I	Power ground. Connect all power grounds to this pin.
AGND	9	I	Analog ground, connect to GND and PGND
SYNC	5	I	Input for synchronization to external clock signal. Synchronizes the converter switching frequency to an external clock signal with CMOS level: SYNC = HIGH: Low-noise mode enabled, fixed frequency PWM operation is forced SYNC = LOW (GND): Power save mode enabled, PFM/PWM mode enabled
VIN	2, 3	I	Supply voltage input (power stage)
VINA	8	I	Supply voltage input (support circuits)
Thermal pad			Connect to AGND

DETAILED DESCRIPTION

OPERATION

The TPS62110 is a synchronous step-down converter that operates with a 1-MHz fixed frequency pulse width modulation (PWM) at moderate-to-heavy load currents and enters the power save mode at light load current.

During PWM operation, the converter uses a unique fast response voltage mode control scheme with input voltage feed-forward. Good line and load regulation is achieved with the use of small input and output ceramic capacitors. At the beginning of each clock cycle initiated by the clock signal (S), the P-channel MOSFET switch is turned on, and the inductor current ramps up until the comparator trips and the control logic turns the switch off. The switch is turned off by the current limit comparator if the current limit of the P-channel switch is exceeded. After the dead time prevents current shoot through, the N-channel MOSFET rectifier is turned on, and the inductor current ramps down. The next cycle is initiated by the clock signal turning off the N-channel rectifier, and turning on the P-channel switch.

The error amplifier as well as the input voltage determines the rise time of the sawtooth generator. Therefore, any change in input voltage or output voltage directly controls the duty cycle of the converter giving a very good line and load transient regulation.

CONSTANT FREQUENCY MODE OPERATION (SYNC = HIGH)

In constant frequency mode, the output voltage is regulated by varying the duty cycle of the PWM signal in the range of 100% to 10%. Connecting the SYNC pin to a voltage greater than 1.5 V forces the converter to operate permanently in the PWM mode even at light or no-load currents. The advantage is that the converter operates with a fixed switching frequency that allows simple filtering of the switching frequency for noise-sensitive applications. In this mode, the efficiency is lower compared to the power save mode during light loads. The N-MOSFET of the devices stay on even when the current into the output drops to zero. This prevents the device from going into discontinuous mode, and the device transfers unused energy back to the input. Therefore, there is no ringing at the output, which usually occurs in discontinuous mode. The duty cycle range in constant frequency mode is 100% to 10%.

It is possible to switch from forced PWM mode to the power save mode during operation by pulling the SYNC pin LOW. The flexible configuration of the SYNC pin during operation of the device allows efficient power management by adjusting the operation of the TPS62110 to the specific system requirements.

POWER SAVE MODE OPERATION (SYNC = LOW)

As the load current decreases, the converter enters the power save mode operation. During power save mode, the converter operates with reduced switching frequency in pulse frequency modulation (PFM), and with a minimum quiescent current to maintain high efficiency. Whenever the average output current goes below the skip threshold, the converter enters the power save mode. The average current depends on the input voltage. It is about 200 mA at low input voltages and up to 400 mA with maximum input voltage. The average output current must be below the threshold for at least 32 clock cycles to enter the power save mode. During the power save mode, the output voltage is monitored with a comparator and the output voltage is regulated in to a typical value between the nominal output voltage and 0.8% above the nominal output voltage. When the output voltage falls below the nominal output voltage, the P-channel switch turns on. The P-channel switch is turned off as the peak switch current is reached. The N-channel rectifier is turned on, and the inductor current ramps down. As the inductor current approaches zero, the N-channel rectifier is turned off and the switch is turned on starting the next pulse. When the output voltage can not be reached with a single pulse, the device continues to switch with its normal operating frequency until the comparator detects the output voltage to be 0.8% above the nominal output voltage. This control method reduces the quiescent current to 20 µA (typical), and reduces the switching frequency to a minimum that achieves the highest converter efficiency.

DETAILED DESCRIPTION (continued)

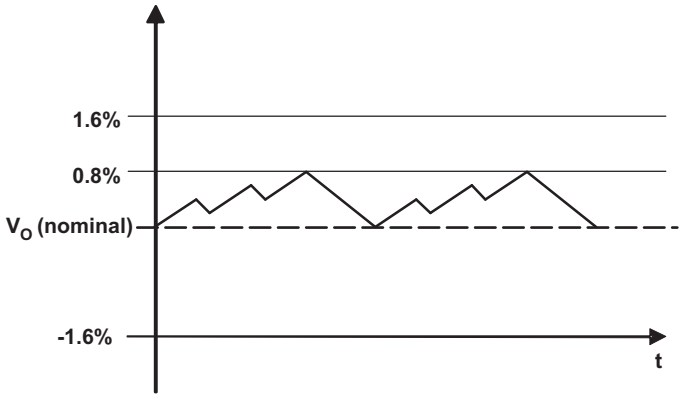

Figure 8. Power Save Mode Output Voltage Thresholds

The typical PFM (SKIP) current threshold for the TPS62110 is given by:

$$I_{SKIP} \approx \frac{V_I}{25\ \Omega} \quad (1)$$

Equation 1 is valid for input voltages up to 7 V. For higher voltages, the skip current threshold is not increased further. The converter enters the fixed frequency PWM mode as soon as the output voltage falls below V_O – 1.6% (nominal).

SOFT START

The TPS62110 has an internal soft-start circuit that limits the inrush current during start-up. This prevents possible voltage drops of the input voltage when a battery or a high-impedance power source is connected to the input of the TPS62110.

The soft start is implemented as a digital circuit increasing the switch current in steps of 300 mA, 600 mA, 1200 mA. The typical switch current limit is 2.4 A. Therefore, the start-up time depends on the output capacitor and load current. Typical start-up time with a 22 µF output capacitor and 800-mA load current is 1 ms.

100% DUTY CYCLE LOW DROPOUT OPERATION

The TPS62110 offers the lowest possible input to output voltage difference while still maintaining operation with the use of the 100% duty cycle mode. In this mode, the P-channel switch is constantly turned on. This is particularly useful in battery-powered applications to achieve the longest operation time, taking full advantage of the whole battery voltage range. The minimum input voltage to maintain regulation depends on the load current and output voltage, and is calculated as:

$$V_I\ \text{min} = V_O\ \text{max} + I_O\ \text{max} \cdot \left(r_{DS(on)}\ \text{max} + R_{(L)}\right) \quad (2)$$

with:

$I_O$max = maximum output current plus inductor ripple current
$r_{DS(on)}$max = maximum P-channel switch $r_{DS(on)}$
$R_{(L)}$ = dc resistance of the inductor
$V_O$max = nominal output voltage plus maximum output voltage tolerance

DETAILED DESCRIPTION (continued)

ENABLE

Logic low on EN forces the TPS62110 into shutdown. In shutdown, the power switch, drivers, voltage reference, oscillator, and all other functions are turned off. The supply current is reduced to less than 2 µA in the shutdown mode. When the device is in thermal shutdown, the bandgap is forced to be switched on even if the device is set into shutdown by pulling EN to GND.

If an output voltage is present when the device is disabled, which could be due to an external voltage source or a super capacitor, the reverse leakage current is specified under electrical characteristics. Pulling the enable pin high starts up the TPS62110 with the soft start. If the EN pin is connected to any voltage other than V_I or GND, an increased leakage current of typically 10 µA and up to 20 µA can occur.

UNDERVOLTAGE LOCKOUT

The undervoltage lockout circuit prevents the device from misoperation at low-input voltages. It prevents the converter from turning on the switch or rectifier MOSFET under undefined conditions. The minimum input voltage to start up the TPS62110 is 3.4 V (worst case). The device shuts down at 2.8 V minimum.

SYNCHRONIZATION

If no clock signal is applied, the converter operates with a typical switching frequency of 1 MHz. It is possible to synchronize the converter to an external clock within a frequency range from 0.8 MHz to 1.4 MHz. The device automatically detects the rising edge of the first clock and synchronizes immediately to the external clock. If the clock signal is stopped, the converter automatically switches back to the internal clock and continues operation. The switch over is initiated if no rising edge on the SYNC pin is detected for a duration of four clock cycles. Therefore, the maximum delay time can be 6.25 µs if the internal clock has its minimum frequency of 800 kHz.

If the device is synchronized to an external clock, the power save mode is disabled, and the devices stay in forced PWM mode.

Connecting the SYNC pin to the GND pin enables the power save mode. The converter operates in the PWM mode at moderate-to-heavy loads, and in the PFM mode during light loads, which maintains high efficiency over a wide load current range.

POWER GOOD COMPARATOR

The power good (PG) comparator has an open-drain output capable of sinking 1 mA (typical). The PG is active only when the device is enabled (EN = high). When the device is disabled (EN = low), the PG pin is pulled to GND.

The PG output is valid only after a 250-µs delay when the device is enabled, and the supply voltage is greater than the undervoltage lockout $V_{(UVLO)}$. PG is low during the first 250 µs after shutdown and in shutdown.

The PG pin becomes active high when the output voltage exceeds 98.4% (typical) of its nominal value. Leave the PG pin unconnected when not used.

LOW-BATTERY DETECTOR

The low-battery output (LBO) is an open-drain type which goes low when the voltage at the low-battery input (LBI) falls below the trip point of 1.256 V ±1.5%. The voltage at which the low-battery warning is issued can be adjusted with a resistive divider as shown in Figure 9. The sum of resistors (R1 + R2) as well as the sum of (R5 + R6) is recommended to be in the 100 kΩ to 1 MΩ range for high efficiency at low output current. An external pullup resistor can be connected to OUT, or any other voltage rail in the voltage range of 0 V to 16 V. During start-up, the LBO output signal is invalid for the first 500 µs. LBO is high impedance when the device is disabled. If the low-battery comparator function is not used, connect LBI to ground. The low-battery detector is disabled when the device is disabled.

The logic level of the LBO pin is not defined for the first 500 µs after EN is pulled high.

When the LBI is used to supervise the battery voltage and shut down the TPS62111 at low-input voltages, the battery voltage rises when the current drops to zero. The implemented hysteresis on the LBI pin may not be sufficient for all types of batteries. Figure 9 shows how an additional external hysteresis can be implemented.

DETAILED DESCRIPTION (continued)

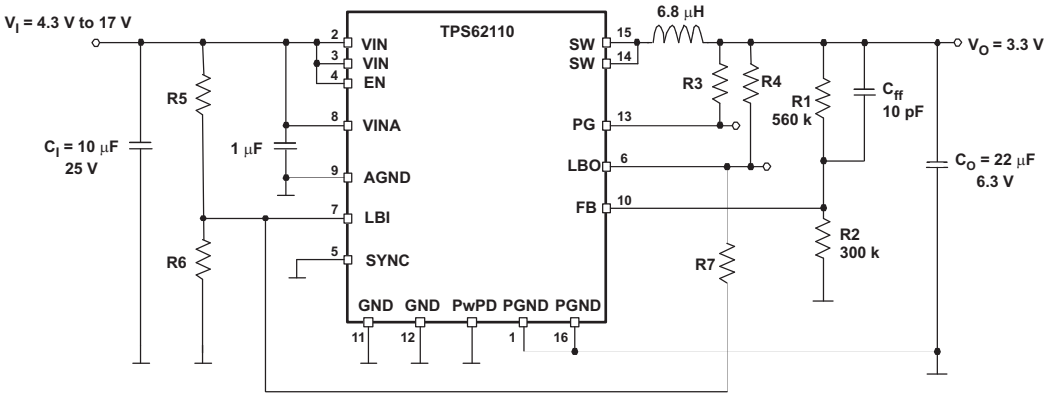

Figure 9. LBI With Increased Hysteresis

NO LOAD OPERATION

When the converter operates in the forced PWM mode and there is no load connected to the output, the converter regulates the output voltage by allowing the inductor current to reverse for a short time.

THEORY OF OPERATION AND DESIGN PROCEDURE

Table 1. List of Inductors

MANUFACTURER (1)	TYPE	INDUCTANCE	DC RESISTANCE	SATURATION CURRENT
Coilcraft	MSS6132-682	6.8 µH	65 mΩ (max)	1.5 A

(1) The manufacturer's part numbers are used for test purposes only.

Inductor Selection

The control loop of the TPS62110 requires a certain value for the output inductor and the output capacitor for stable operation. As long as the nominal value of L × C ≥ 6.2 µH × 22 µF, the control loop has enough phase margin and the device is stable. Reducing the inductor value without increasing the output capacitor (or vice versa) may cause stability problems. There are applications where it may be useful to increase the value of the output capacitor, e.g., for a low transient output voltage change. From a stability point of view, the inductor value could be decreased to keep the L × C product constant. However, there are drawbacks if the inductor value is decreased. A low inductor value causes a high inductor ripple current and therefore reduces the maximum dc output current. Table 2 gives the advantages and disadvantages when designing the inductor and output capacitor.

Table 2. Advantages and Disadvantages When Designing the Inductor and Output Capacitor

	INFLUENCE ON STABILITY	ADVANTAGE	DISADVANTAGE
Increase C_{out} (>22 µF)	Uncritical	Less output voltage ripple Less output voltage overshoot / undershoot during load transient	None
Decrease C_{out} (<22 µF)	Critical Increase inductor value >6.8 µH also	None	Higher output voltage ripple High output voltage overshoot / undershoot during load transient Less gain and phase margin
Increase L (>6.8 µH)	Uncritical	Less inductor current ripple Higher dc output current possible if operated close to the current limit	More energy stored in the inductor → higher voltage overshoot during load transient Smaller current rise → higher voltage undershoot during load transient → do not decrease the value of Cout due to these effects
Decrease L (<6.8 µH)	Critical Increase output capacitor value > 22 µF also	Small voltage overshoot / undershoot during load transient	High inductor current ripple especially at high input voltage and low output voltage

As it is shown in Table 2, the inductor value can be increased to higher values. For good performance, the peak-to-peak inductor current ripple should be less than 30% of the maximum dc output current. Especially at input voltages above 12 V, it makes sense to increase the inductor value to keep the inductor current ripple low. In such applications, the inductor value can be increased to 10 µH or 22 µH. Values above 22 µH should be avoided to keep the voltage overshoot during load transient in an acceptable range.

After choosing the inductor value, two additional inductor parameters should be considered:

1. current rating of the inductor
2. dc resistance

The dc resistance of the inductance directly influences the efficiency of the converter. Therefore, an inductor with lowest dc resistance should be selected for highest efficiency. To avoid saturation of the inductor, the inductor should be rated at least for the maximum output current plus the inductor ripple current which is calculated as:

$$\Delta I_L = V_O \times \frac{1 - \frac{V_O}{V_I}}{L \times f} \qquad I_L\,max = I_O\,max + \frac{\Delta I_L}{2} \tag{3}$$

Where:

f = Switching frequency (1000 kHz typical)

L = Inductor value

ΔI_L = Peak-to-peak inductor ripple current

I_L(max) = Maximum inductor current

The highest inductor current occurs at maximum V_I. A more conservative approach is to select the inductor current rating just for the maximum switch current of the TPS62110, which is 2.4 A (typically). See Table 1 for recommended inductors.

OUTPUT CAPACITOR SELECTION

A 22 µF (typical) output capacitor is needed with a 6.8 µH inductor. For an output voltage greater than 5 V, a 33 µF (minimum) output capacitor is required for stability. For best performance, a low ESR ceramic output capacitor is needed.

The RMS ripple current is calculated as:

$$I_{RMS}(C_O) = V_O \times \frac{1 - \frac{V_O}{V_I}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \quad (4)$$

The overall output ripple voltage is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charge and discharging the output capacitor:

$$\Delta V_O = V_O \times \frac{1 - \frac{V_O}{V_I}}{L \times f} \times \left(\frac{1}{8 \times C_O \times f} + R_{ESR} \right) \quad (5)$$

Where the highest output voltage ripple occurs at the highest input voltage V_I.

INPUT CAPACITOR SELECTION

The nature of the buck converter is a pulsating input current; therefore, a low ESR input capacitor is required for best input voltage filtering, and minimizing the interference with other circuits caused by high input voltage spikes. The input capacitor should have a minimum value of 10 µF and can be increased without any limit for better input voltage filtering. The input capacitor should be rated for the maximum input ripple current calculated as:

$$I_{RMS} = I_O \text{ max} \times \sqrt{\frac{V_O}{V_I} \times \left(1 - \frac{V_O}{V_I}\right)} \quad (6)$$

The worst-case RMS ripple current occurs at D = 0.5 and is calculated as: $I_{RMS} = I_O/2$. Ceramic capacitors show a good performance because of their low ESR value, and they are less sensitive against voltage transients compared to tantalum capacitors. Place the input capacitor as close as possible to the input pin of the IC for best performance

FEEDFORWARD CAPACITOR SELECTION

The feedforward capacitor (C_{ff}) is needed to compensate for parasitic capacitance from the feedback pin to GND. Typically, a value of 4.7 pF to 22 pF is needed for an output voltage divider with a equivalent resistance (R1 in parallel with R2) in the 150 kΩ range. The value can be chosen based on best transient performance and lowest output voltage ripple in PFM mode.

RECOMMENDED CAPACITORS

It is recommended that only X5R or X7R ceramic capacitors be used as input/output capacitors. Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the output and input capacitor of a dc/dc converter. The effect may lead to a significant capacitance drop especially for high input/output voltages and small capacitor packages. See the manufacturer's data sheet about the performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value to get the required value at the operating point. The capacitors listed in Table 3 have been tested with the TPS62110 with good performance.

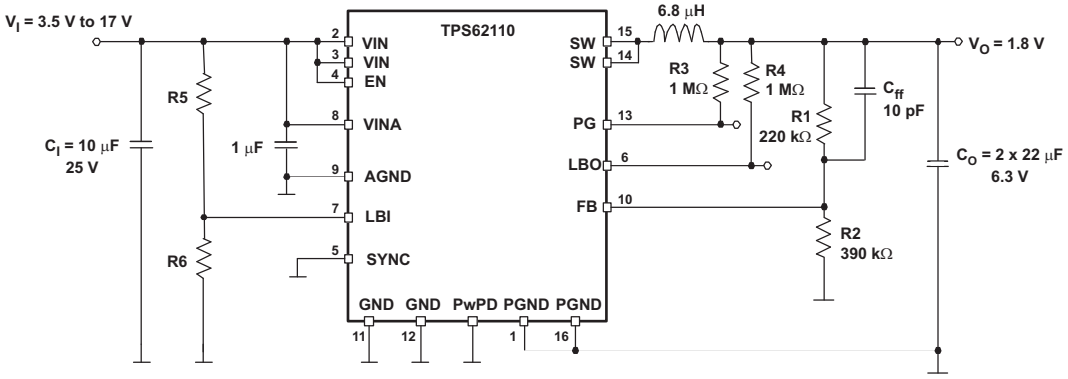
	C3216X5R1E106MT	1206	25 V	10 µF	

APPLICATION INFORMATION



A. For an output voltage lower than 2.5 V, an output capacitor of 33 µF or greater is recommended to improve load transient.

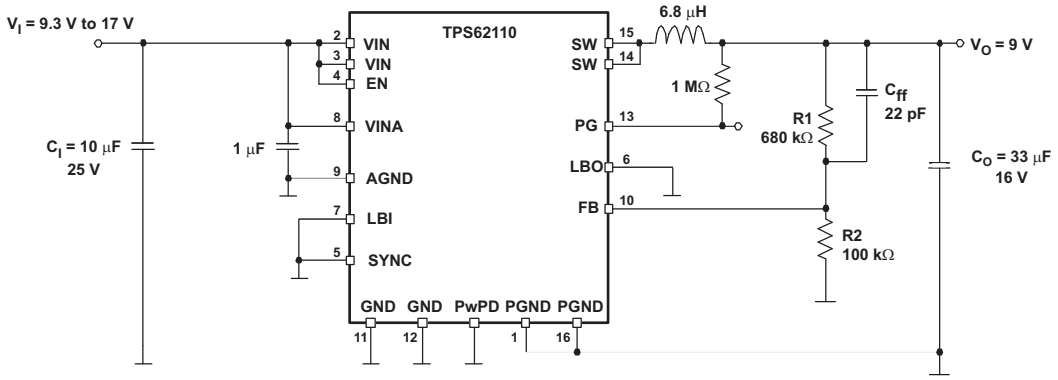
Figure 10. Standard Connection

$$V_O = V_{FB} \times \frac{R1 + R2}{R2} \qquad R1 = R2 \times \left(\frac{V_O}{V_{FB}} \right) - R2 \tag{7}$$

V_{FB} = 1.153 V

Table 4. Recommended Resistors

OUTPUT VOLTAGE	R1	R2	NOMINAL VOLTAGE	TYPICAL C_{ff}
9 V	680 kΩ	100 kΩ	8.993 V	22 pF
5 V	510 kΩ	150 kΩ	5.073 V	10 pF
3.3 V	560 kΩ	300 kΩ	3.305 V	10 pF
2.5 V	390 kΩ	330 kΩ	2.515 V	10 pF
1.8 V	220 kΩ	390 kΩ	1.803 V	10 pF
1.5 V	100 kΩ	330 kΩ	1.502 V	10 pF



A. For an output voltage greater than 5 V, an output capacitor of 33 µF minimum is required for stability.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/ Ball Finish	MSL Pea
TPS62110QRSARQ1	ACTIVE	QFN	RSA	16	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.
information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all
lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable fo
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package,
the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retard
in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

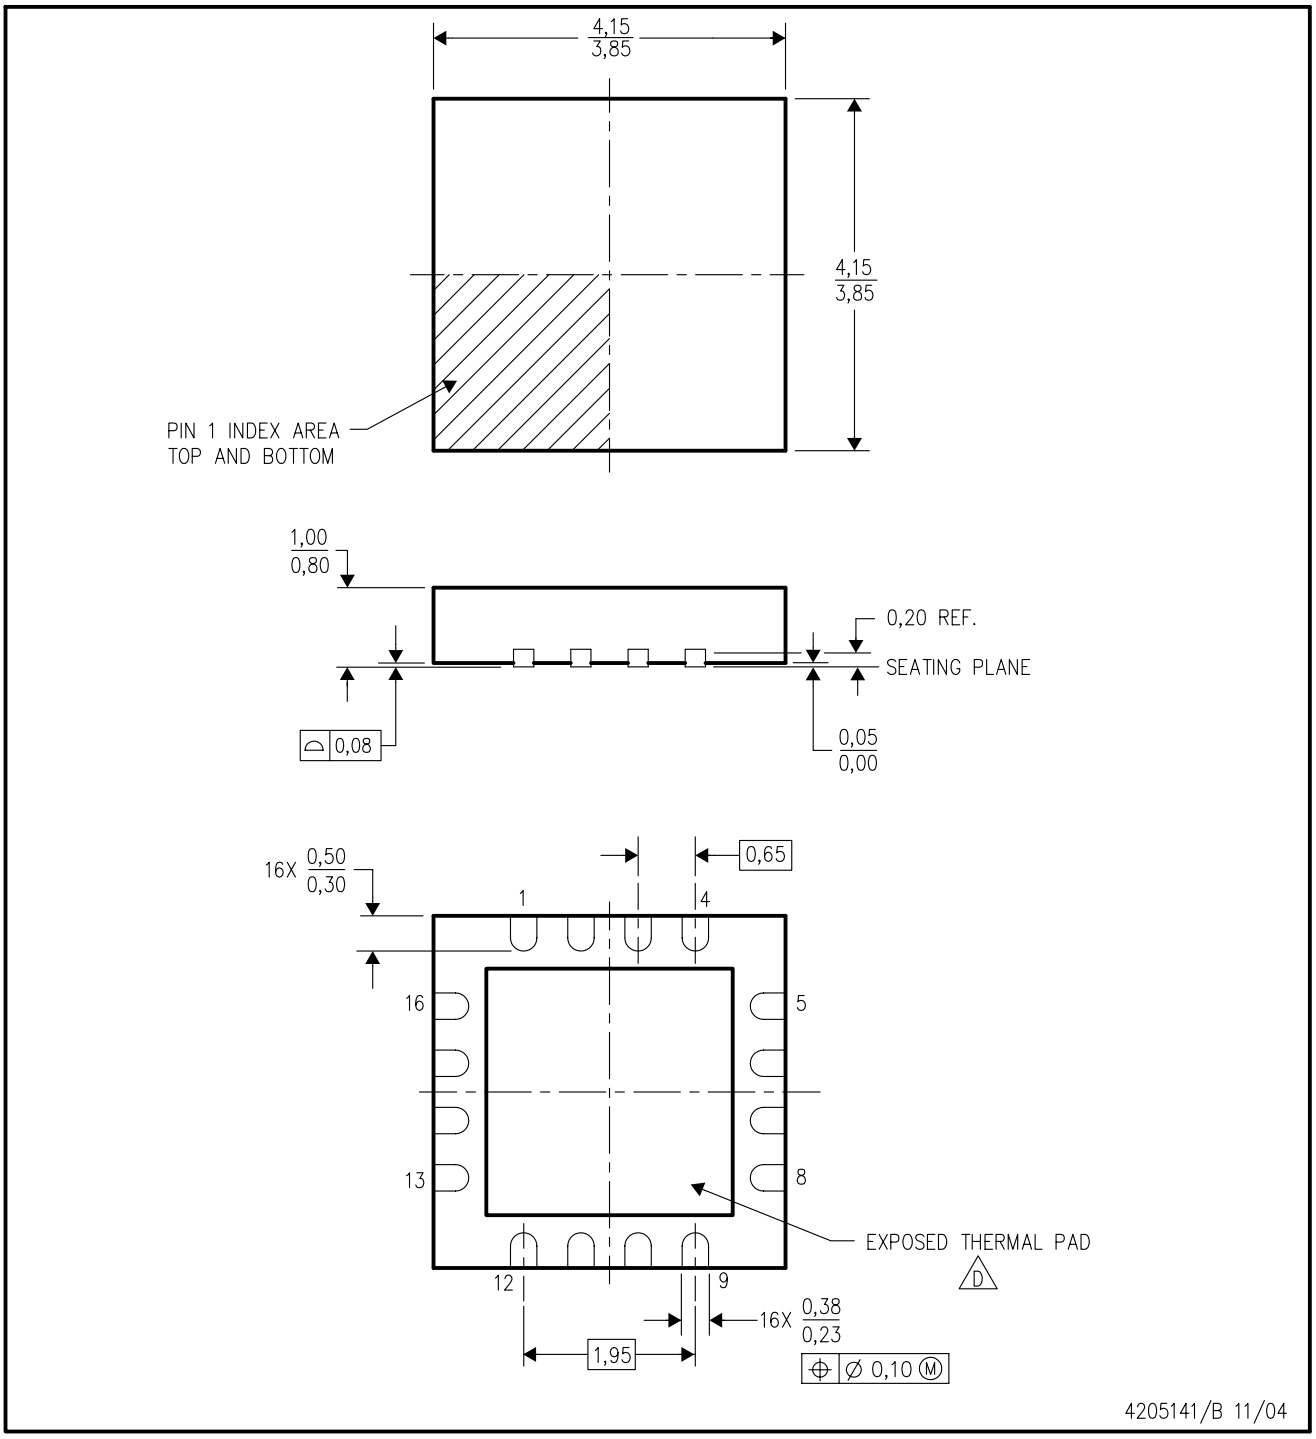
RSA (S–PQFP–N16) PLASTIC QUAD FLATPACK



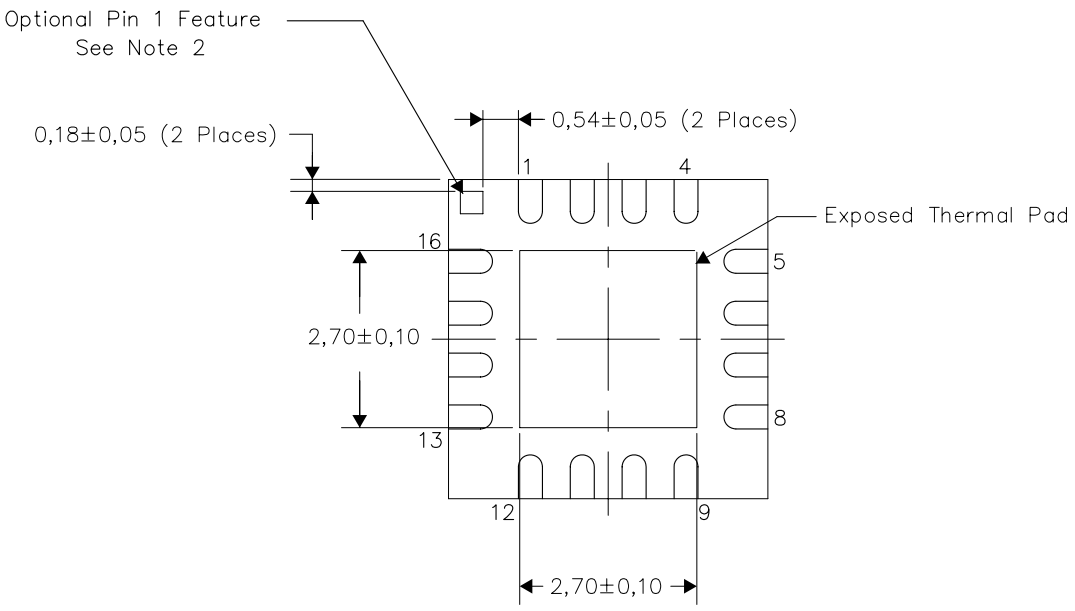
NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Quad Flatpack, No–leads (QFN) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
E. Falls within JEDEC MO–220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.



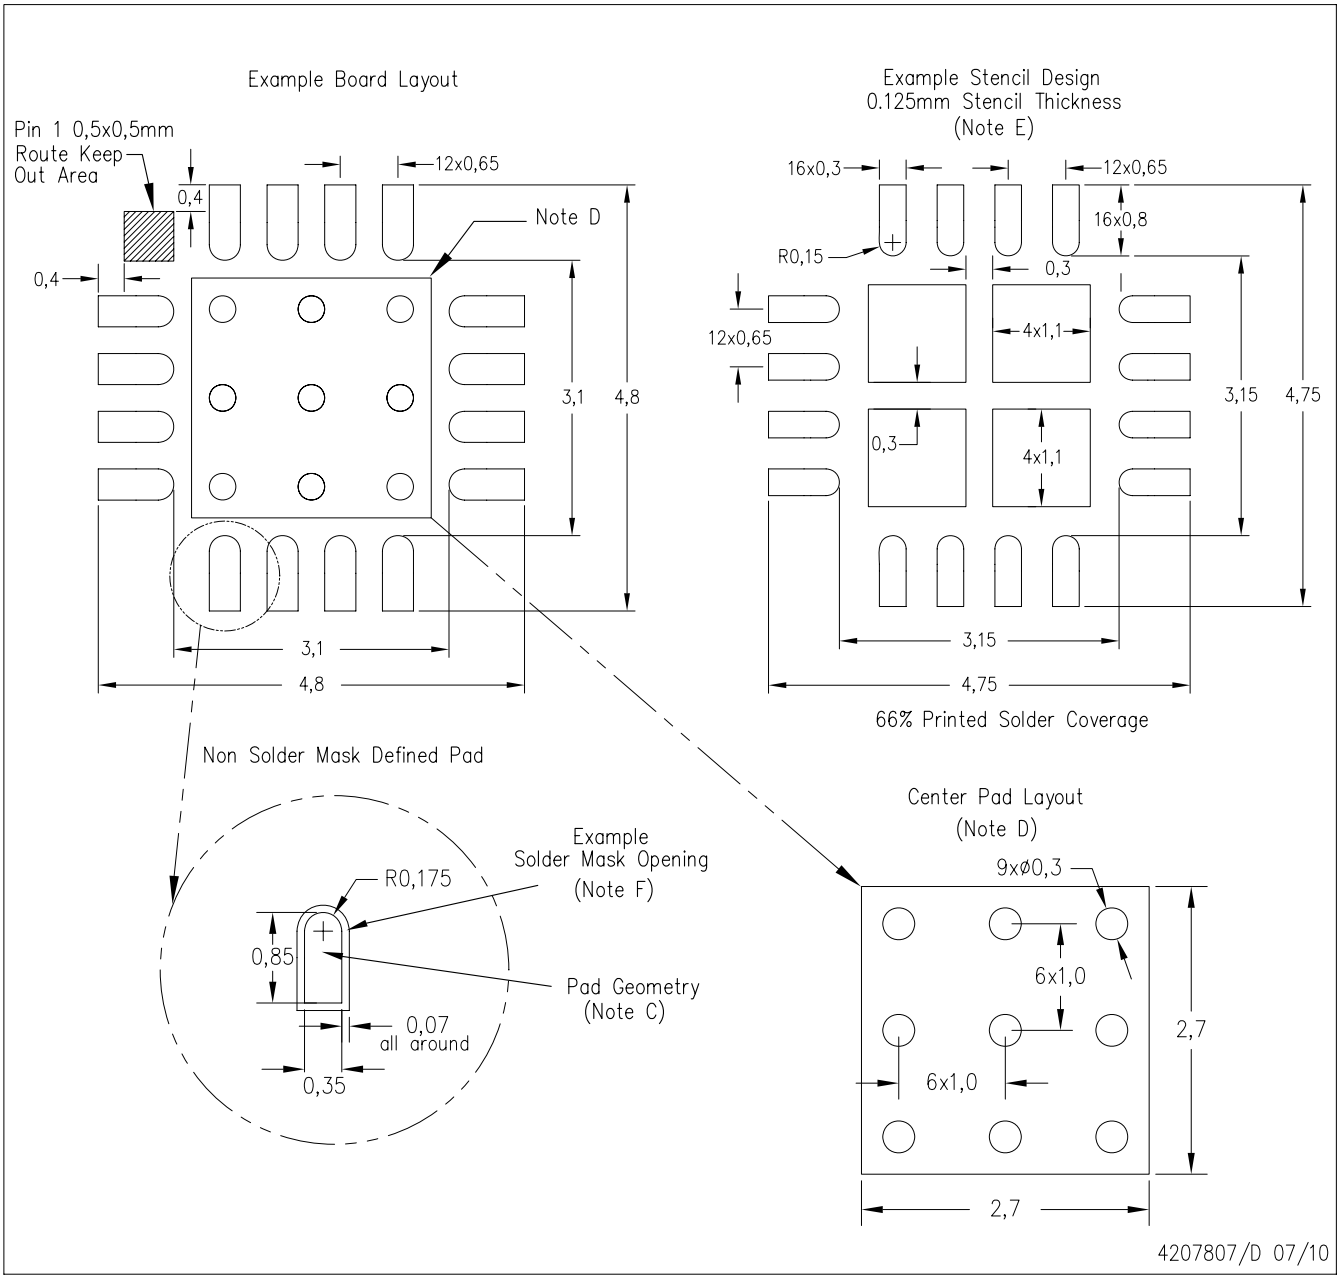
Bottom View

Exposed Thermal Pad Dimensions

NOTES:

1) All linear dimensions are in millimeters
2) The Pin 1 Identification mark is an optional feature that may be present on some devices In addition, this Pin 1 feature if present is electrically connected to the center thermal pad and therefore should be considered when routing the board layout.

RSA (S–PVQFN–N16) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for solder mask tolerances.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
