VOLTAGE-OUTPUT UNIDIRECTIONAL-MEASUREMENT CURRENT-SHUNT MONITORS

Check for Samples: **INA270-Q1, INA271-Q1**

## FEATURES

- **Qualified for Automotive Applications**
- **Wide Common-Mode Range: –16 V to 80 V**
- **CMRR: 120 dB**
- **Accuracy:**
  - **±2.5-mV Offset (Max)**
  - **±1% Gain Error (Max)**
  - **20-μV/°C Offset Drift (Max)**
  - **55-ppm/°C Gain Drift (Max)**
- **Bandwidth: Up to 130 kHz**
- **Two Transfer Functions Available:**
  - **14 V/V (INA270)**
  - **20 V/V (INA271)**
- **Quiescent Current: 900 μA (Max)**
- **Power Supply: 2.7 V to 18 V**
- **Provision for Filtering**

APPLICATIONS

- **Power Management**
- **Automotive**
- **Telecom Equipment**
- **Notebook Computers**
- **Battery Chargers**
- **Cell Phones**
- **Welding Equipment**

DESCRIPTION/ORDERING INFORMATION

The INA270 and INA271 family of current-shunt monitors with voltage output can sense voltage drops across current shunts at common-mode voltages from –16 V to 80 V, independent of the supply voltage. The INA270 and INA271 pinouts readily enable filtering.

The INA270 and INA271 are available with two output voltage scales: 14 V/V and 20 V/V. The 130-kHz bandwidth simplifies use in current-control loops.

The INA270 and INA271 operate from a single 2.7-V to 18-V supply, drawing a maximum of 900 μA of supply current. They are specified over the extended operating temperature range of –40°C to 125°C and are offered in an SO-8 package.

ORDERING INFORMATION[1]

T_A	GAIN	PACKAGE[2]		ORDERABLE PART NUMBER	TOP-SIDE MARKING
–40°C to 125°C	14	SOIC – D	Reel of 2500	INA270AQDRQ1	INA270
	20			INA271AQDRQ1	INA271

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

FUNCTIONAL BLOCK DIAGRAM
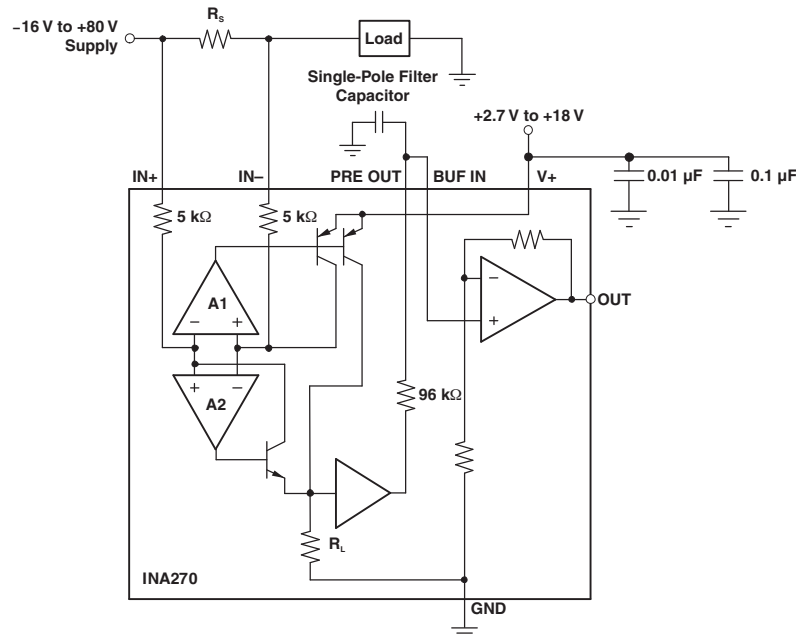

ABSOLUTE MAXIMUM RATINGS[(1)]

over operating free-air temperature range (unless otherwise noted)

		VALUE
V_S	Supply voltage	18 V
	Differential analog input voltage range ($V_{IN+} - V_{IN-}$)	–18 V to 18 V
	Common-mode analog input voltage range	–16 V to 80 V
V_O	Analog output voltage range (OUT and PRE OUT)	(GND – 0.3) V to (V+ + 0.3) V
I_I	Input current (any pin)	5 mA
θ_{JA}	Package thermal impedance[(2) (3)]	97.1°C/W
T_J	Maximum junction temperature	150°C
T_A	Operating free-air temperature range	–40 to 125°C
T_{stg}	Storage temperature range	–65 to 150°C
ESD	Electrostatic discharge rating	Human-Body Model HBM)	2000 V
		Machine Model (MM)	100 V
		Charged-Device Model (CDM)	1000 V

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Maximum power dissipation is a function of T_J(max), θ_{JA}, and T_A. The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(max) - T_A)/\theta_{JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.
(3) The package thermal impedance is calculated in accordance with JESD 51-7.

APPLICATION INFORMATION

Basic Connection

Figure 1 illustrates the basic connection of the INA270 and INA271. The input pins, IN+ and IN–, should be connected as closely as possible to the shunt resistor to minimize any resistance in series with the shunt resistance. Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Minimum bypass capacitors of 0.01 μF and 0.1 μF in value should be placed close to the supply pins. Although not mandatory, an additional 10-mF electrolytic capacitor placed in parallel with the other bypass capacitors may be useful in applications with particularly noisy supplies.

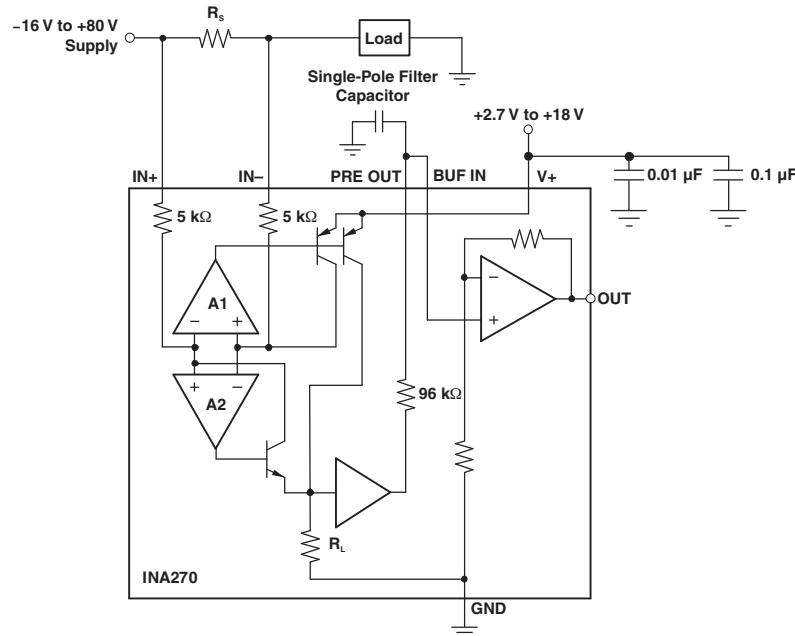

Figure 1. INA270 Basic Connections

Power Supply

The input circuitry of the INA270 and INA271 can accurately measure beyond its power-supply voltage, V+. For example, the V+ power supply can be 5 V, whereas the load power-supply voltage is up to 80 V. The output voltage range of the OUT terminal, however, is limited by the voltages on the power-supply pin.

Selecting R_S

The value chosen for the shunt resistor, R_S, depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, while low values of R_S minimize voltage loss in the supply line. For most applications, best performance is attained with an R_S value that provides a full-scale shunt voltage range of 50 mV to 100 mV. Maximum input voltage for accurate measurements is $(V_S - 0.2)/\text{Gain}$.

Transient Protection

The –16-V to 80-V common-mode range of the INA270 and INA271 is ideal for withstanding automotive fault conditions ranging from 12-V battery reversal up to 80-V transients, since no additional protective components are needed up to those levels. In the event that the INA270 and INA271 are exposed to transients on the inputs in excess of their ratings, external transient absorption with semiconductor transient absorbers (zeners or Transzorbs) are necessary.

Use of MOVs or VDRs is not recommended except when they are used in addition to a semiconductor transient absorber. Select the transient absorber such that it will never allow the INA270 and INA271 to be exposed to transients greater than 80 V (that is, allow for transient absorber tolerance, as well as additional voltage because of transient absorber dynamic impedance).

Despite the use of internal zener-type ESD protection, the INA270 and INA271 are not suited to using external resistors in series with the inputs, since the internal gain resistors can vary up to ±30%, but the internal resistors are tightly matched. If gain accuracy is not important, then resistors can be added in series with the INA270 and INA271 inputs, with two equal resistors on each input.

Output Voltage Range

The output of the INA270 and INA271 is accurate within the output voltage swing range set by the power-supply pin, V+.

The INA270 and INA271 readily enable the inclusion of filtering between the preamp output and buffer input. Single-pole filtering can be accomplished with a single capacitor because of the 96-kΩ output impedance at PRE OUT on pin 3 (see Figure 2a).

The INA270 and INA271 readily lend themselves to second-order Sallen-Key configurations (see Figure 2b). When designing these configurations consider that the PRE OUT 96-kΩ output impedance exhibits an initial variation of ±30% with the addition of a –2200-ppm/°C temperature coefficient.

a) Single-Pole Filter   b) Second-Order, Sallen-Key Filter
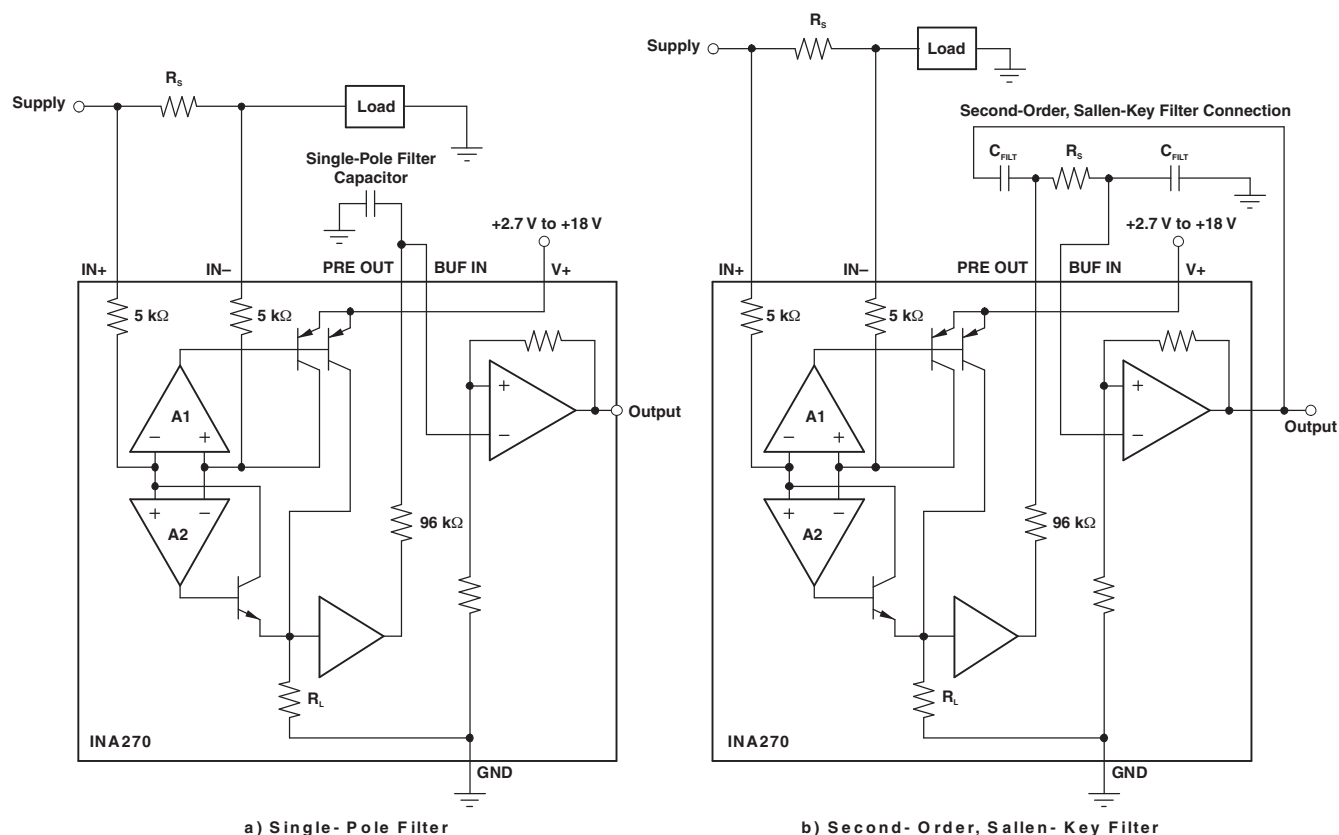

A. The INA270 and INA271 can be easily connected for first-order or second-order filtering. Remember to use the appropriate buffer gain (INA270 = 1.4, INA271 = 2) when designing Sallen-Key configurations.

Figure 2. First-Order or Second-Order Filtering

Accuracy Variations as a Result of V$_{SENSE}$ and Common-Mode Voltage

The accuracy of the INA270 and INA271 current-shunt monitors is a function of two main variables: V$_{SENSE}$ (V$_{IN+}$ − V$_{IN-}$) and common-mode voltage, V$_{CM}$, relative to the supply voltage, V$_S$. V$_{CM}$ is expressed as (V$_{IN+}$ + V$_{IN-}$)/2; however, in practice, V$_{CM}$ is seen as the voltage at V$_{IN+}$ because the voltage drop across V$_{SENSE}$ is usually small.

This section addresses the accuracy of these specific operating regions:

Normal Case 1: V$_{SENSE}$ ≥ 20 mV, V$_{CM}$ ≥ V$_S$
Normal Case 2: V$_{SENSE}$ ≥ 20 mV, V$_{CM}$ < V$_S$
Low V$_{SENSE}$ Case 1: V$_{SENSE}$ < 20 mV, −16 V ≤ V$_{CM}$ < 0
Low V$_{SENSE}$ Case 2: V$_{SENSE}$ < 20 mV, 0 V ≤ V$_{CM}$ ≤ V$_S$
Low V$_{SENSE}$ Case 3: V$_{SENSE}$ < 20 mV, V$_S$ < V$_{CM}$ ≤ 80 V

Normal Case 1: V$_{SENSE}$ ≥ 20 mV, V$_{CM}$ ≥ V$_S$

This region of operation provides the highest accuracy. Here, the input offset voltage is characterized and measured using a two-step method. First, the gain is determined by Equation 1.

$$G = \frac{V_{OUT1} - V_{OUT2}}{100\ mV - 20\ mV}$$

(1)

Where:

V$_{OUT1}$ = Output voltage with V$_{SENSE}$ = 100 mV
V$_{OUT2}$ = Output voltage with V$_{SENSE}$ = 20 mV

Then the offset voltage is measured at V$_{SENSE}$ = 100 mV and referred to the input (RTI) of the current-shunt monitor, as shown in Equation 2.

$$V_{os}RTI\ (referred\ to\ input) = \left(\frac{V_{OUT1}}{G} \right) - 100\ mV$$

(2)

In Typical Characteristics, the Output Error vs Common-Mode Voltage curve shows the highest accuracy for the this region of operation. In this plot, V$_S$ = 12 V; for V$_{CM}$ ≥ 12 V, the output error is at its minimum. This case is also used to create the V$_{SENSE}$ ≥ 20 mV output specifications in Electrical Characteristics.

Low V$_{SENSE}$ Case 1: V$_{SENSE}$ < 20 mV, −16 V ≤ V$_{CM}$ < 0; and
Low V$_{SENSE}$ Case 3: V$_{SENSE}$ < 20 mV, V$_S$ < V$_{CM}$ ≤ 80 V

Although the INA270 family of devices are not designed for accurate operation in either of these regions, some applications are exposed to these conditions. For example, when monitoring power supplies that are switched on and off while V$_S$ is still applied to the INA270 or INA271, it is important to know what the behavior of the devices is in these regions.

As V$_{SENSE}$ approaches 0 mV, in these V$_{CM}$ regions, the device output accuracy degrades. A larger-than-normal offset can appear at the current-shunt monitor output with a typical maximum value of V$_{OUT}$ = 60 mV for V$_{SENSE}$ = 0 mV. As V$_{SENSE}$ approaches 20 mV, V$_{OUT}$ returns to the expected output value with accuracy as specified in Electrical Characteristics. Figure 3 illustrates this effect using the INA271 (Gain = 20).

Product Folder Link(s): *INA270-Q1 INA271-Q1*

INA270A-Q1"

Figure 3. Example for Low V_{SENSE} Cases 1 and 3 (INA271, Gain = 20)

Low V_{SENSE} Case 2: V_{SENSE} < 20 mV, 0 V ≤ V_{CM} ≤ V_S

This region of operation is the least accurate for the INA270 family. To achieve the wide input common-mode voltage range, these devices use two operational amplifier (op amp) front ends in parallel. One op amp front end operates in the positive input common-mode voltage range, and the other in the negative input region. For this case, neither of these two internal amplifiers dominates and overall loop gain is very low. Within this region, V_{OUT} approaches voltages close to linear operation levels for Normal Case 2.

This deviation from linear operation becomes greatest the closer V_{SENSE} approaches 0 V. Within this region, as V_{SENSE} approaches 20 mV, device operation is closer to that described by Normal Case 2. Figure 4 illustrates this behavior for the INA271. The V_{OUT} maximum peak for this case is determined by maintaining a constant V_S, setting V_{SENSE} = 0 mV and sweeping V_{CM} from 0 V to V_S. The exact V_{CM} at which V_{OUT} peaks during this case varies from part to part. The maximum peak voltage for the INA270 is 0.28 V; for the INA271, the maximum peak voltage is 0.4 V.

Figure 4. Example for Low V_{SENSE} Case 2 (INA271, Gain = 20)

Shutdown

The INA270 and INA271 do not provide a shutdown pin; however, because they consume a quiescent current less than 1 mA, they can be powered by either the output of logic gates or by transistor switches to supply power. Driving the gate low shuts down the INA270/INA271. Use a totem-pole output buffer or gate that can provide sufficient drive along with 0.1-μF bypass capacitor, preferably ceramic with good high-frequency characteristics. This gate should have a supply voltage of 3 V or greater, because the INA270 and INA271 require a minimum supply greater than 2.7 V. In addition to eliminating quiescent current, this gate also turns off the 10-μA bias current present at each of the inputs. Note that the IN+ and IN– inputs are able to withstand full common-mode voltage under all powered and under-powered conditions. An example shutdown circuit is shown in Figure 5.

Figure 5. INA270/INA271 Example Shutdown Circuit

RFI/EMI

Attention to good layout practices is always recommended. Keep traces short and, when possible, use a printed circuit board (PCB) ground plane with surface-mount components placed as close to the device pins as possible. Small ceramic capacitors placed directly across amplifier inputs can reduce RFI/EMI sensitivity. PCB layout should locate the amplifier as far away as possible from RFI sources. Sources can include other components in the same system as the amplifier itself, such as inductors (particularly switched inductors handling a lot of current and at high frequencies). RFI can generally be identified as a variation in offset voltage or dc signal levels with changes in the interfering RF signal. If the amplifier cannot be located away from sources of radiation, shielding may be needed. Twisting wire input leads makes them more resistant to RF fields. The difference in input pin location of the INA270 and INA271 versus the INA193 through INA198 may provide different EMI performance.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
