LXMG1618-03-2x

3.3V 2.2W CCFL Programmable Inverter Module

**PRODUCTION DATASHEET** 

### **DESCRIPTION**

The LXMG1618-03-2x is a Single Output 2.2W Direct Drive<sup>TM</sup> CCFL (Cold range dimming, amplitude control results Cathode Fluorescent Lamp) Inverter in lower ripple on the input supply and Module specifically designed for driving reduced LCD backlight lamps. It is ideal for generation. Many STN type panels are driving typical 3.9" to 6.4" panels.

The maximum output current is amplitude dimming. externally programmable over a range of 3.5 to 5mA in 0.5mA steps to allow the the system battery or AC adapter directly inverter to properly match to a wide array of LCD panel lamp current specifications. The modules are include a dimming input that permits brightness control from either available (LXMG1618-05-2x). a DC voltage source, a PWM signal or an external potentiometer.

LXMG1618 modules unlike LXMG1617 series does not provide wide range 'burst' mode dimming, rather dimming is provided by amplitude control of the output current waveform, this limits are stable fixed-frequency operation, the potential dim range to typically less than 5:1.

For applications not requiring wide potential transient particularly well suited for current

The modules convert DC voltage from to high frequency, high-voltage waves required to ignite and operate CCFL lamps. A 5V input inverter is also

The modules design is based on Microsemi's new LX1689 backlight the controller, which provides a number of cost and performance advantages due to the controller's high level of integration.

Other benefits of this new topology secondary-side strike-voltage regulation and both open and shorted lamp protection with fault timeout.

IMPORTANT: For the most current data, consult MICROSEMI's website: http://www.microsemi.com Protected By U.S. Patents: 5,923,129; 5,930,121; 6,198,234; Patents Pending

### **KEY FEATURES**

- Externally Programmable Maximum Output Current
- Easy to Use Brightness Control
- Output Short-Circuit Protection and Automatic Strike-Voltage Regulation and Timeout
- Analog Current Amplitude Dimming Method
- Fixed Frequency Operation
- Rated From -20 to 70°C
- UL60950 E175910
- **RoHS Compliant**

## **APPLICATIONS**

- PDA's
- Portable Instrumentation
- **Industrial Display Controls**

### **BENEFITS**

- Compact, Low Profile Design
- Mates to a wide variety of LCD Panels
- Output Open Circuit Voltage **Regulation Minimizes** Corona Discharge For High Reliability

ABSOLUTE MAXIMUM RATINGS	(NOTE 1)
Input Signal Voltage (V <sub>IN1</sub> ) Input Power Output Voltage, no load Output Current Output Power	
Input Signal Voltage (SLEEP Input)	0.3V to 5V 20°C to 70°C
Note 1: Exceeding these ratings could cause damage to the device. All voltages are with respect to Gr terminal.	round. Currents are positive into, negative out of specified

### RECOMMENDED OPERATING CONDITIONS (R.C.)

This module has been designed to operate over a wide range of input and output conditions. However, best efficiency and performance will be obtained if the module is operated under the condition listed in the 'R.C.' column. Min. and Max. columns indicate values beyond which the inverter, although operational, will not function optimally.

Parameter	Symbol	Recommended Operating Conditions			Units	
raiametei	Symbol	Min	R.C.	Max	Office	
Input Supply Voltage Range (Fully Regulated Lamp Current)	V <sub>IN1</sub>	3	3.3	3.6	V	
Input Supply Voltage Range (Functional)		2.9		4.2		
Output Power	Po			2.2	W	
Linear BRITE Control Input Voltage Range <sup>1</sup>	$V_{BRT\ ADJ}$	0.65 to 0.9		2.0	V	
Lamp Operating Voltage	$V_{LAMP}$	325	380	435*	$V_{RMS}$	
Lamp Current (Full Brightness)	I <sub>OLAMP</sub>	3.5		5 <sup>†</sup>	mA <sub>RMS</sub>	
Operating Ambient Temperature Range	T <sub>A</sub>	-20		70	°C	

 $<sup>^{1}\</sup>text{The minimum }V_{\text{BRT ADJ}}\text{ voltage depends on the panel characteristics, depending on the panel it can vary from 0.65V to 0.9V$ 

### **ELECTRICAL CHARACTERISTICS**

Unless otherwise specified, the following specifications apply over the recommended operating condition and ambient temperature of 25°C except where otherwise noted.

Parameter	Symbol	Test Conditions	LXMG1618-03-2x			Units
Faranietei	Syllibol	rest Conditions	Min	Тур	Max	Ullits
OUTPUT PIN CHARACTERISTICS						
Full Bright Lamp Current	I <sub>L(MAX)</sub>	$V_{BRT\_ADJ} \ge 2.0V_{DC}$ , $\overline{SLEEP} \ge 2.0V$ , $V_{IN1} = 3.3V_{DC}$ $I_{SET1} = Ground$ , $I_{SET2} = Ground$	3.0	3.5	4.0	mA <sub>RMS</sub>
Full Bright Lamp Current	I <sub>L(MAX)</sub>	$V_{BRT\_ADJ} \ge 2.0V_{DC}$ , $\overline{SLEEP} \ge 2.0V$ , $V_{IN1} = 3.3V_{DC}$ $I_{SET1} = Ground$ , $I_{SET2} = Open$	3.5	4.0	4.5	mA <sub>RMS</sub>
Full Bright Lamp Current	I <sub>L(MAX)</sub>	$V_{BRT\_ADJ} \ge 2.0V_{DC}$ , $\overline{SLEEP} \ge 2.0V$ , $V_{IN1} = 3.3V_{DC}$ $I_{SET1} = Open$ , $I_{SET2} = Ground$	4.0	4.5	5.0	mA <sub>RMS</sub>
Full Bright Lamp Current	I <sub>L(MAX)</sub>	$V_{BRT\_ADJ} \ge 2.0V_{DC}$ , $\overline{SLEEP} \ge 2.0V$ , $V_{IN1} = 3.3V_{DC}$ $I_{SET1} = Open$ , $I_{SET2} = Open$	4.5	5	5.5	mA <sub>RMS</sub>
Min. Average Lamp Current	I <sub>L(MIN)</sub>	$V_{BRT\_ADJ}$ = 0.65 $V_{DC}$ , $\overline{SLEEP} \ge 2.0V$ , $V_{IN1}$ = 3.3 $V_{DC}$ $I_{SET1}$ = $I_{SET2}$ = Ground		1.5*		mA <sub>RMS</sub>
Lamp Start Voltage	V <sub>LS</sub>	-20°C < T <sub>A</sub> < 70°C, V <sub>IN1</sub> > 3.15V <sub>DC</sub>	1000	1100		V <sub>RMS</sub>
Operating Frequency	fo	$V_{BRT\_ADJ} = 2.5V_{DC}, \overline{SLEEP} \ge 2.0V, V_{IN1} = 3.3V$	85	90	94	kHz

<sup>\*</sup> The Inverter is capable of a lower output current than may be recommended by the panel manufacturer. It is the user's responsibility to set the minimum brightness (BRITE) input at or above the panel specification for minimum current.

<sup>\*</sup>Total output power must not exceed 2.2W . Higher voltage lamps may require maximum output current to be set lower than 5mA<sub>RMS</sub> †At voltages below 3.6V the inverter may not be able to output the full 5mA<sub>RMS</sub> in all configurations.

### TYPICAL APPLICATION

Figure 1 – Brightness Control (Output current set to maximum)

Figure 1A - PWM Brightness Control

Figure 2 – Max Output Current (SET<sub>1</sub> and SET<sub>2</sub> Inputs)

- The brightness control may be a voltage output DAC or other voltage source, a digital pot or 20K manual pot. The inverter contains an internal 10K pull-up to 3V to bias the pot add a 2.7K resistor to set the lower threshold voltage. A 3.3V Logic Level PWM signal from a micro-controller may also be used as shown in Figure 1A.
- If you need to turn the inverter ON/OFF remotely, connect to TTL logic signal to the <u>SLEEP</u> input.
- Connect V<sub>HI</sub> to high voltage wire from the lamp. Connect V<sub>LO</sub> to the low voltage wire (wire with thinner insulation). Never connect V<sub>LO</sub> to circuit ground as this will defeat lamp current regulation. If both lamp wires have heavy high voltage insulation, connect the longest wire to V<sub>LO</sub>. This wire is typically white.
- Use the SET<sub>1</sub> and SET<sub>2</sub> (see Figure 2) inputs to select the desired maximum output current. Using these two pins in combination allows the inverter to match a wide variety of panels from different manufactures. Generally the best lamp lifetime and efficiency correlates with driving the CCFL at the manufactures nominal current setting. However the SET<sub>1</sub> and SET<sub>2</sub> inputs allow the user the flexibility to adjust the current to the maximum allowable output current to increase panel brightness at the expense of some reduced lamp life.
- Although the SET pins are designed such that just leaving them open or grounding them is all that is needed to set the output current, they can also be actively set. Using a open collector or open drain logic signal will allow you to reduce the lamp current for situations where greater dim range is required, as an example in nighttime situations. In conjunction with a light sensor or other timer the panel could be set to higher brightness (maximum output current) for daytime illumination and lower brightness (minimum or typical output current) at nighttime. Since the dim ratio is a factor the peak output current, using this technique the effective dim ratio can be increased. Conversely the SET inputs could be used to overdrive the lamp temporarily to facilitate faster lamp warm up at initial lamp turn on. Of course any possible degradation on lamp life from such practices is the users responsibility as not all lamps are designed to be overdriven.
- The inverter has a built in fault timeout function. If the output is open (lamp disconnected or broken) or shorted the inverter will attempt to strike the lamp for several seconds. After about 2 seconds without success the inverter will shutdown. In order to restart the inverter it is necessary to toggle the sleep input or cycle the V<sub>IN1</sub> input supply.
