74ACTQ16244 16-Bit Buffer/Line Driver with 3-STATE Outputs

General Description

The ACTQ16244 contains sixteen non-inverting buffers with 3-STATE outputs designed to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver. The device is nibble controlled. Each nibble has separate 3-STATE control inputs which can be shorted together for full 16-bit operation.

The ACTQ16244 utilizes Fairchild's Quiet Series technology to guarantee quiet output switching and improved dynamic threshold performance. FACT Quiet Series™ features GTO™ output control for superior performance.

Features

- Utilizes Fairchild's FACT Quiet Series technology
- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Guaranteed pin-to-pin output skew
- Separate control logic for each byte and nibble
- 16-bit version of the ACTQ244
- Outputs source/sink 24 mA
- Additional specs for multiple output switching
- Output loading specs for both 50 pF and 250 pF loads

Ordering Code:

| Order Number | Package Number | Package Description |
|----------------|----------------|---|
| 74ACTQ16244SSC | MS48A | 48-Lead Small Shrink Outline Package (SSOP), JEDEC MO-118, 0.300" Wide |
| 74ACTQ16244MTD | MTD48 | 48-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide |

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

Logic Symbol

Pin Description

| Pin Names | Description |
|-------------------|----------------------------------|
| \overline{OE}_n | Output Enable Input (Active LOW) |
| I_0 - I_{15} | Inputs |

Functional Description

The ACTQ16244 contains sixteen non-inverting buffers with 3-STATE standard outputs. The device is nibble (4 bits) controlled with each nibble functioning identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation. The 3-STATE outputs are controlled by an Output Enable (\overline{OE}_n) input for each nibble. When \overline{OE}_n is LOW, the outputs are in 2-state mode. When \overline{OE}_n is HIGH, the outputs are in the high impedance mode, but this does not interfere with entering new data into the inputs.

Truth Tables

| Inputs | | Outputs |
|-------------------|--------------------------------|--------------------------------|
| \overline{OE}_1 | I ₀ -I ₃ | O ₀ -O ₃ |
| L | L | L |
| L | H | H |
| H | X | Z |

| Inputs | | Outputs |
|-------------------|--------------------------------|--------------------------------|
| \overline{OE}_2 | I ₄ -I ₇ | O ₄ -O ₇ |
| L | L | L |
| L | H | H |
| H | X | Z |

| Inputs | | Outputs |
|-------------------|---------------------------------|---------------------------------|
| \overline{OE}_3 | I ₈ -I ₁₁ | O ₈ -O ₁₁ |
| L | L | L |
| L | H | H |
| H | X | Z |

| Inputs | | Outputs |
|-------------------|----------------------------------|----------------------------------|
| \overline{OE}_4 | I ₁₂ -I ₁₅ | O ₁₂ -O ₁₅ |
| L | L | L |
| L | H | H |
| H | X | Z |

H = HIGH Voltage Level
 L = LOW Voltage Level
 X = Immaterial
 Z = High Impedance

| Absolute Maximum Ratings (Note 1) | | Recommended Operating Conditions | |
|--|--------------------------|---|----------------|
| Supply Voltage (V_{CC}) | -0.5V to +7.0V | Supply Voltage (V_{CC}) | 4.5V to 5.5V |
| DC Input Diode Current (I_{IK}) | | Input Voltage (V_I) | 0V to V_{CC} |
| $V_I = -0.5V$ | -20 mA | Output Voltage (V_O) | 0V to V_{CC} |
| $V_I = V_{CC} + 0.5V$ | +20 mA | Operating Temperature (T_A) | -40°C to +85°C |
| DC Output Diode Current (I_{OK}) | | Minimum Input Edge Rate ($\Delta V/\Delta t$) | 125 mV/ns |
| $V_O = -0.5V$ | -20 mA | V_{IN} from 0.8V to 2.0V | |
| $V_O = V_{CC} + 0.5V$ | +20 mA | V_{CC} @ 4.5V, 5.5V | |
| DC Output Voltage (V_O) | -0.5V to $V_{CC} + 0.5V$ | Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation of FACT™ circuits outside databook specifications. | |
| DC Output Source/Sink Current (I_O) | ±50 mA | | |
| DC V_{CC} or Ground Current per Output Pin | ±50 mA | | |
| Junction Temperature | +140°C | | |
| Storage Temperature | -65°C to +150°C | | |

| t _{PZH} | Output Enable | 5.0 | 3.5 | | 10.1 | (Note 13) | | ns |
| t _{PZL} | Time | | 3.4 | | 10.0 | | | |
| t _{PHZ} | Output Disable | 5.0 | 3.6 | | 8.9 | (Note 14) | | ns |
| t _{PLZ} | Time | | 3.1 | | 8.1 | | | |
| t _{OSHL} (Note 10) | Pin to Pin Skew HL Data to Output | 5.0 | | | 1.2 | | | ns |
| t _{OSLH} (Note 10) | Pin to Pin Skew LH Data to Output | 5.0 | | | 2.5 | | | |
| t _{OSt} (Note 10) | Pin to Pin Skew LH/HL Data to Output | 5.0 | | | 4.3 | | | ns |

Note 9: Voltage Range 5.0 is 5.0V ± 0.5V.

Note 10: Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH-to-LOW (t_{OSHL}), LOW-to-HIGH (t_{OSLH}), or any combination switching LOW-to-HIGH and/or HIGH-to-LOW (t_{OSt}).

Note 11: This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).

Note 12: This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.

Note 13: 3-STATE delays are load dominated and have been excluded from the datasheet.

Note 14: The Output Disable Time is dominated by the RC network (500Ω, 250 pF) on the output and has been excluded from the datasheet.

Capacitance

| Symbol | Parameter | Typ | Units | Conditions |
|-----------------|-------------------------------|-----|-------|------------------------|
| C _{IN} | Input Pin Capacitance | 4.5 | pF | V _{CC} = 5.0V |
| C _{PD} | Power Dissipation Capacitance | 30 | pF | V _{CC} = 5.0V |

FACT Noise Characteristics

The setup of a noise characteristics measurement is critical to the accuracy and repeatability of the tests. The following is a brief description of the setup used to measure the noise characteristics of FACT.

Equipment:

- Hewlett Packard Model 8180A Word Generator
- PC-163A Test Fixture
- Tektronics Model 7854 Oscilloscope

Procedure:

1. Verify Test Fixture Loading: Standard Load 50 pF, 500Ω.
2. Deskew the HFS generator so that no two channels have greater than 150 ps skew between them. This requires that the oscilloscope be deskewed first. It is important to deskew the HFS generator channels before testing. This will ensure that the outputs switch simultaneously.
3. Terminate all inputs and outputs to ensure proper loading of the outputs and that the input levels are at the correct voltage.
4. Set the HFS generator to toggle all but one output at a frequency of 1 MHz. Greater frequencies will increase DUT heating and affect the results of the measurement.

V_{OHV} and V_{OLP} are measured with respect to ground reference.

Input pulses have the following characteristics: $f = 1 \text{ MHz}$, $t_r = 3 \text{ ns}$, $t_f = 3 \text{ ns}$, skew $< 150 \text{ ps}$.

FIGURE 1. Quiet Output Noise Voltage Waveforms

5. Set the HFS generator input levels at 0V LOW and 3V HIGH for ACT devices and 0V LOW and 5V HIGH for AC devices. Verify levels with an oscilloscope.

V_{OLP}/V_{OLV} and V_{OHP}/V_{OHV} :

- Determine the quiet output pin that demonstrates the greatest noise levels. The worst case pin will usually be the furthest from the ground pin. Monitor the output voltages using a 50Ω coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- Measure V_{OLP} and V_{OLV} on the quiet output during the worst case transition for active and enable. Measure V_{OHP} and V_{OHV} on the quiet output during the worst case active and enable transition.
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.

V_{ILD} and V_{IHD} :

- Monitor one of the switching outputs using a 50Ω coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- First increase the input LOW voltage level, V_{IL} , until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds V_{IL} limits, or on output HIGH levels that exceed V_{IH} limits. The input LOW voltage level at which oscillation occurs is defined as V_{ILD} .
- Next decrease the input HIGH voltage level, V_{IH} , until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds V_{IL} limits, or on output HIGH levels that exceed V_{IH} limits. The input HIGH voltage level at which oscillation occurs is defined as V_{IHD} .
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements
