F100150 Hex D Latch

General Description

The F100150 contains six D-type latches with true and complement outputs, a pair of common Enables (\mathbb{E}_a and \mathbb{E}_b), and a common Master Reset (MR). A Q output follows its D input when both \mathbb{E}_a and \mathbb{E}_b are LOW. When either \mathbb{E}_a or \mathbb{E}_b (or both) are HIGH, a latch stores the last valid data present on its D input before \mathbb{E}_a or \mathbb{E}_b went HIGH. The MR input

overrides all other inputs and makes the Q outputs LOW. All inputs have 50 $k\Omega$ pull-down resistors.

Refer to the F100350 datasheet for:

PCC packaging

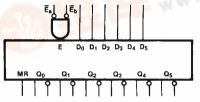

Lower power

Military versions

Extended voltage specs (-4.2V to -5.7V)

Ordering Code: See Section 8

Logic Symbol

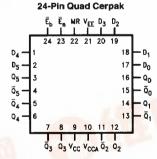

TIL	/F/	98	58	-3

Pin Names	Description
D ₀ -D ₅	Data Inputs
$\overline{E}_a, \overline{E}_b$	Common Enable Inputs (Active LOW)
MR	Asynchronous Master Reset Input
Q ₀ -Q ₅	Data Outputs
$\overline{Q}_0 - \overline{Q}_5$	Complementary Data Outputs

I _{IL}	Input LOW Current	0.50			μΑ	$V_{IN} = V_{IL (Min)}$		

Note 1: Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Parametric values specified at -4.2V to -4.8V.

Note 3: The specified limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

Note 4: Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
