

Micropower Dual Timer

GENERAL DESCRIPTION

The XR-L556 dual timer contains two independent micropower timer sections on a monolithic chip. It is a direct replacement for the conventional 556-type dual timers, for applications requiring very low power dissipation. Each section of the XR-L556 dual timer is equivalent to Exar's XR-L555 micropower timer. The circuit dissipates only 1/15th of the stand-by power of conventional dual timers and can operate down to 2.5 volts without sacrificing such key features as timing accuracy and stability. At 5 volt operation, typical power dissipation of the dual-timer circuit is less than 2 mW; and it can operate in excess of 500 hours with only two 300 mA-Hr NiCd batteries.

The two timer sections of the circuit have separate controls and outputs, but share common supply and ground terminals. Each output can source up to 100 mA of output current or drive TTL circuits.

FEATURES

- Replaces two XR-L555 Micropower Timers
- Same Pinout as Standard 556-Type Dual Timer
- Less than 1 mW Power Dissipation per Section ($V_{CC} = 5V$)
- Timing from Microseconds to Minutes
- Over 500-Hour Operation with 2 NiCd Batteries
- Low Voltage Operation ($V_{CC} = 2.7V$)
- Operates in Both Monostable and Astable Modes
- CMOS TTL and DTL Compatible Outputs
- Introduces No Switching Transients

APPLICATIONS

- Battery Operated Timing
- Micropower Clock Generator
- Pulse Shaping and Detection
- Micropower PLL Design
- Power-On Reset Controller
- Micropower Oscillator
- Sequential Timing
- Pulse-Width Modulation
- Appliance Timing
- Remote-Control Sequencer

ABSOLUTE MAXIMUM RATINGS

XR-L556 CP	Plastic	0 $^\circ C$ to +70 $^\circ C$

SYSTEM DESCRIPTION

The XR-L556 is a micropower version of the industry standard XR-556 timing circuit, capable of both monostable and astable operation with timing intervals ranging from low microseconds up through several hours. Timing is independent of supply voltage, which may range from 2.5 V to 15 V. The output stage can source 100 mA. Each timer section is fully independent and similar to the XR-L555. The XR-L556 is not a direct replacement for a CMOS 556, although the pinout is the same.

In the monostable (one shot) mode, timing is determined by one resistor and capacitor. Astable operation (oscillation) requires an additional resistor, which controls duty cycle. An internal resistive divider provides a reference voltage of $2/3 V_{CC}$, which produces a timing interval of $1.1 RC$. As the reference is related to V_{CC} , the interval is independent of supply voltage; however, for maximum accuracy, the user should ensure V_{CC} does not vary during timing.

The output of the XR-L556 is high during the timing interval. It is triggered and reset on falling waveforms. The control voltage inputs (Pins 3 and 11) may serve as pulse width modulation points.

XR-L556

ELELTRICAL CHARACTERISTICS

Test Conditions: ($T_A = 25^\circ\text{C}$, $V_{CC} = +5\text{V}$, unless otherwise specified)

PARAMETERS	XR-L556C			UNITS	CONDITION
	MIN	TYP	MAX		
Supply Voltage	2.7		15	V	
Supply Current (Each Timer Section)		200	500	μA	Low State Output $V_{CC} = 5\text{V}$, $R_L = \infty$
Total Supply Current (Both Timer Sections)		400	1000	μA	
Timing Error				%	$R_A, R_B = 1\text{K}\Omega$ to $100\text{K}\Omega$ $C = 0.1\text{ }\mu\text{F}$ $0^\circ\text{C} \leq T_T < 70^\circ\text{C}$ • Monostable Operation

XR-L556

FEATURES OF XR-L556

The XR-L556 micropower dual timer is, in most instances, a direct pin-for-pin replacement for the conventional 556-type dual timer. However, compared to conventional 556-timer, it offers the following important performance features:

Reduced Power Dissipation: The current drain is 1/15th of the conventional 556-type dual timer.

No Supply Current Transients: The conventional 556-timer can produce 300 to 400 mA of supply current spikes during switching of either one of its timer sections. The XR-L556 is virtually transient-free as shown in Figure 12.

Low-Voltage Operation: The XR-L556 operates down to 2.7 volts of supply voltage, vs. 4.5V minimum operating voltage needed for conventional 556-timer. Thus, the XR-L556 can operate safely and reliably with two 1.5V NiCd batteries.

Proven Bipolar Technology: The XR-L556 is fabricated using conventional bipolar process technology. Thus, it is immune to electrostatic burn-out problems associated with low-power timers using CMOS technology.

PRINCIPLES OF OPERATION

MONOSTABLE (ONE-SHOT) OPERATION

The circuit connection for monostable, or one-shot operation is one of the timer sections of the XR-L556 is shown in Figure 1. The internal flip-flop is triggered by lowering the trigger level to less than $1/3 V_{CC}$. The circuit triggers on a negative-going slope. Upon triggering, the flip-flop is set, which releases the short circuit across the capacitor and also moves the output level toward V_{CC} . The voltage across the capacitor, therefore, starts increasing exponentially with a time constant $\tau = R_A C$. A comparator is referenced to $2/3 V_{CC}$ with the use of three equal internal resistors. When the voltage across the capacitor reaches this level, the flip-flop is reset, the capacitor is discharged rapidly, the output level moves toward ground and the timing cycle is completed. The duration of the timing period, T , during which the output logic level is at a "high" state is given by the equation:

$$T = 1.1 R_A C$$

This time delay varies linearly with the choice of R_A and C as shown by the timing curves of Figure 13. For proper operation of the circuit, the trigger pulse-width *must be* less than the timing period.

Once the circuit is triggered it is immune to additional trigger inputs until the present period has been completed. The timing-cycle can be interrupted by using the reset control. When the reset control is "low", the internal discharge transistor is turned "on" and prevents the capacitor from charging. As long as the reset voltage is applied, the digital output level will remain unchanged

Figure 12. Comparison of Supply Current Transient of Conventional NE556 Dual Timer with XR-L556 Micropower Dual Timer

i.e. "low". The reset pin should be connected to $+V_{CC}$ when not used to avoid the possibility of false triggering.

ASTABLE (SELF-TRIGGERING) OPERATION

For astable (or self-triggering) operation, the correct circuit connection is shown in Figure 2. The external capacitor charges to $2/3 V_{CC}$ through the series combination of R_A and R_B , and discharges to $1/3 V_{CC}$ through R_B . In this manner, the capacitor voltage oscillates between $1/3 V_{CC}$ and $2/3 V_{CC}$, with an exponential waveform. The output level at pin 5 (or 9) is high during the charging cycle, and goes low during the discharge cycle. The charge and the discharge times are independent of supply voltage. The oscillations can be keyed "on" and "off" using the reset controls (pin 4 or 10).

Figure 13. Timing Period, T , as a Function of External R-C Network

The charge time (output high) is given by:

$$t_1 = 0.695 (R_A + R_B)C$$

The discharge time (output low) is by:

$$t_2 = 0.695 (R_B)C$$

Thus the total period is given by:

$$T = t_1 + t_2 = 0.695 ((R_A + 2R_B)C)$$

The frequency of oscillation is then:

$$f = \frac{1}{T} = \frac{1.44}{(R_A + 2R_B)C} \text{ and}$$

may be easily found as shown in Figure 14.

The duty cycle D , is given by:

$$D = \frac{R_B}{R_A + 2R_B}$$

APPLICATIONS INFORMATION

INDEPENDENT TIME DELAYS

Each timer section of the XR-L556 can operate as an independent timer to generate a time delay, T , set by the respective external timing components. Figure 15 is a circuit connection where each section is used separately in the monostable mode to produce respective time delays of T_1 and T_2 , where:

$$T_1 = 1.1 R_1 C_1 \text{ and } T_2 = 1.1 R_2 C_2$$

SEQUENTIAL TIMING (DELAYED ONE-SHOT)

In this application, the output of one timer section (Timer 1) is capacitively coupled to the trigger terminal of the second, as shown in Figure 16. When Timer 1 is triggered at pin 6, its output at pin 5 goes "high" for a time duration $T_1 = 1.1 R_1 C_1$. At the end of this timing cycle, pin 5 goes "low" and triggers Timer 2 through the capacitive coupling, C_C , between pins 5 thru 8. Then, the output at pin 9 goes "high" for a time duration

Figure 15. Generation of Two Independent Time Delays

Figure 14. Free Running Frequency as a Function of External Timing Components (Note: $R = R_A + 2R_B$)

$T_2 = 1.1 R_2 C_2$. In this manner, the unit behaves as a "delayed one-shot" where the output of Timer 2 is delayed from the initial trigger at pin 6 by a time delay of T_1

KEYED OSCILLATOR

One of the timer sections of the XR-L556 can be operated in its free-running mode, and the other timer section can be used to key it "on" and "off". A recommended circuit connection is shown in Figure 17. Timer 2 is used as the oscillator section, and its frequency is set by the resistors R_A , R_B and the capacitor C_2 . Timer 1 is operated as a monostable circuit, and its output is connected to the reset terminal (pin 10 of Timer 2).

When the circuit is at rest, the logic level at the output of Timer 1 is "low"; and the oscillations of Timer 2 are inhibited. Upon application of a trigger signal to Timer 1, the logic level at pin 1 goes "high" and the oscillator section (Timer 2) is keyed "on". Thus, the output of Timer 2 appears as a tone burst whose frequency is set by R_A , R_B and C_2 , and whose duration is set by R_1 and C_1 of Figure 17.

Figure 16. Sequential Timing

XR-L556

Figure 17. Keyed Oscillator

FREQUENCY DIVIDER AND PULSE SHAPER

If the frequency of the input is known, each timer section of the XR-L556 can be used as a frequency divider by adjusting the length of its timing cycle. If the timing interval $T_1 (= 1.1 R_1 C_1)$ is larger than the period of the input pulse trigger, then only those input pulses which are spaced more than $1.1 R_1 C_1$ will actually trigger the circuit.

The output frequency is equal to $(1/N)$ times the input frequency. The division factor N is in the range:

$$\frac{T}{T_P} - 1 < N < \frac{T}{T_P}$$

where T_P is the period of the input pulse signal.

Since the two timer sections of the XR-L556 are electrically independent, each can be used as a frequency divider. Thus, if the trigger terminals of both timer sections are connected to a common input, the XR-L556 can produce two independent outputs at frequencies f_1 and f_2 :

$$f_1 = f_2/N_1 \text{ and } f_2 = f_3/N_2$$

Where N_1 and N_2 are the division factors for respective timer sections, set by external resistors and capacitors at pins (1, 2) and (12, 13).

Frequency division can be performed by 1/2 of the XR-L556. The remaining timer section can be used as a "pulse-shaper" to adjust the duty cycle of the output waveform. As seen in Figure 18, Timer 1 is used as the frequency divider section and Timer 2 is used as the pulse shaper.

The output of Timer 1 (pin 5) triggers Timer 2, which produces an output pulse whose frequency is the same as the output frequency of Timer 1, and whose duty cycle is controlled by the timing resistor and capacitor of Timer 2. The duty cycle of the output of Timer 2 (pin 9) can be adjusted from 1% to 99% by varying the value of R_2 .

Figure 18. Frequency Divider and Pulse-Shaper

MICROPOWER OSCILLATOR WITH INDEPENDENT FREQUENCY AND DUTY CYCLE ADJUSTMENT

If Timer 1 is operated in its astable mode and Timer 2 is operated in its monostable mode, as shown in Figure 19, then an oscillator with fixed frequency and variable duty cycle results.

Timer 1 generates a basic periodic waveform that is then used to trigger Timer 2. If the time delay, T_2 , of Timer 2 is chosen to be less than the period of oscillations of Timer 1, then the output at pin 9 has the same frequency as Timer 1, but has its duty cycle determined by the timing cycle of Timer 2. The output duty cycle can be adjusted over a wide range (from 1% to 99%) by adjusting R_2 .

XR-1488/1489A

Quad Line Driver/Receiver

GENERAL DESCRIPTION

The XR-1488 is a monolithic quad line driver designed to interface data terminal equipment with data communications equipment in conformance with the specifications of EIA Standard No. RS232C. This extremely versatile integrated circuit can be used to perform a wide range of applications. Features such as output current limiting, independent positive and negative power supply driving elements, and compatibility with all DTL and TTL logic families greatly enhance the versatility of the circuit.

The XR-1489A is a monolithic quad line receiver designed to interface data terminal equipment with data communications equipment. The XR-1489A quad receiver along with its companion circuit, the XR-1488 quad driver, provide a complete interface system between DTL or TTL logic levels and the RS232C defined voltage and impedance levels.

XR-1489AN	Ceramic	0°C to +70°C
XR-1489AP	Plastic	0°C to +70°C

SYSTEM DESCRIPTION

The XR-1488 and XR-1489A are a matched set of quad line drivers and line receivers designed for interfacing between TTL/DTL and RS232C data communication lines.

The XR-1488 contains four independent split supply line drivers, each with a ± 10 mA current limited output. For RS232C applications, the slew rate can be reduced to the 30 V/ μ S limit by shunting the output to ground with a 410 pF capacitor. The XR-1489A contains four independent line receivers, designed for interfacing RS232C to TTL/DTL. Each receiver features independently programmable switching thresholds with hysteresis, and input protection to ± 30 V. The output can typically source 3 mA and sink 20 mA.
